# **AN8808SB**

Three-Beam Method Head Amplifier IC for CD (supporting the hologram pick-up)

#### Overview

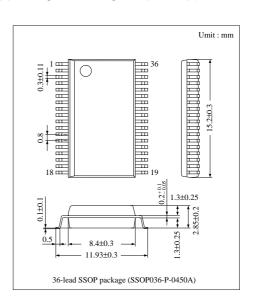

The AN8808SB is a head amplifier IC supporting the digital servo (supporting the voltage output hologram pick). Combination of this IC and the MN6627XX series allows the rational CD system to be constructed with small number of external parts.

#### ■ Features

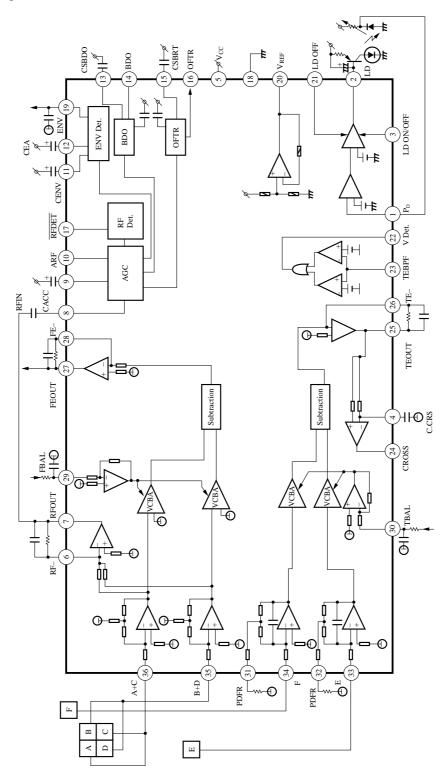

- Single supply operation
- I–V amplifier, tracking error amplifier, focus error amplifier, RF amplifier and APC built-in
- Detectors of DO, CROSS, OFTR and vibration built-in
- Combination with the MN6627XX series providing complete automatic adjustment for tracking balance, tracking gain, tracking offset, focus balance, focus gain and focus offset

## Application

CD player

## ■ Block Diagram

## ■ Pin Description

Pin No.	Pin Name	I/O	Function Description	
1	$P_D$	I	Signal input of P <sub>D</sub> for LD output monitor	
2	LD	О	Connected to base of external Tr for LD drive	
3	LDON	I	ON/OFF switching of LD APC	
4	C. CRS		Capacity connecting pin for CROSS	
5	V <sub>CC</sub>		Supply connecting pin	
6	RF-	I	Reverse rotation input pin of RF Amp. for connecting a resistance	
7	RFOUT	0	Output pin of RF Amp. (reverse rotation amp.)	
8	RFIN	I	RF AGC input pin	
9	C. AGC		C-connecting pin for RF AGC loop filter	
10	ARF	О	RF output pin after AGC	
11	C. ENV		C-connecting pin for RF	
12	C. EA		C-connecting pin for amp.	
13	C. SBDO		C-connecting pin for low speed detection of dark level DO	
14	BDO	О	BDO detection output pin; positive logic	
15	C. SBRT		C-connecting pin for OFTR low speed detection	
16	OFTR	0	OFF TRACK detection output pin; positive logic	
17	NRFDET	0	Output pin of RF signal amplitude detection; negative logic	
18	GND		Ground pin	
19	ENV	0	ENV output pin	
20	V <sub>REF</sub>	0	$V_{CC} \times 0.5$ (V) output pin	
21	LD OFF	I	Input pin for forced stop of LD APC	
22	VDET	О	Output pin of amplitude detection	
23	TEBPF	I	Input pin of amplitude detection	
24	CROSS	О	Output pin of TE CROSS detection signal	
25	TEOUT	О	Output pin of TE Amp.	
26	TE-	I	Reverse rotation input pin of TE Amp. for connecting a resistance	
27	FEOUT	О	Output pin of FE Amp.	
28	FE-	I	Reverse rotation input pin of FE Amp. for connecting a resistance	
29	FBAL	I	Control signal input pin for FO balance adjustment	
30	TBAL	I	Control signal input pin for TE balance adjustment	
31	PDFR	_	Resistance-connected pin setting the I –V conversion resistance value of PDE	
32	PDER	_	Resistance-connected pin setting the I –V conversion resistance value of PDF	
33	PDE	I	Connected to PIN Diode E	
34	PDF	I	Connected to PIN Diode F	
35	PDBD	I	Connected to B/D of astigmatic 4-division P <sub>D</sub>	
36	PDAC	I	Connected to A/C of astigmatic 4-division P <sub>D</sub>

## ■ Operational Description (The values shown below are design values when supply voltage Vcc=5V.)

## • RF Amplifier

As shown in Figure 1, RF signals are generated by three-beam method pick-up. Equivalent resistance to RFOUT (Pin7) is  $127k\Omega$ , when resistance between RF– and RFOUT is  $12k\Omega$ .

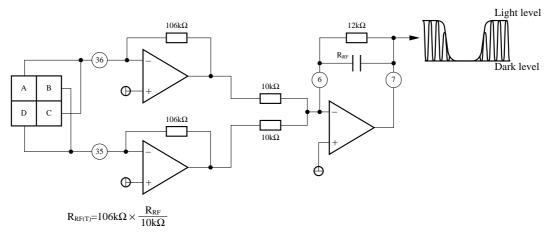

Figure 1: RF Amplifier

## • Focus Error Amplifier

As shown in Figure 2, the operation result of (A+C) – (B+D) is outputted to FEOUT (Pin27). Equivalent resistance to FEOUT is  $212k\Omega$ , when resistance between FE and FEOUT is  $20k\Omega$ .

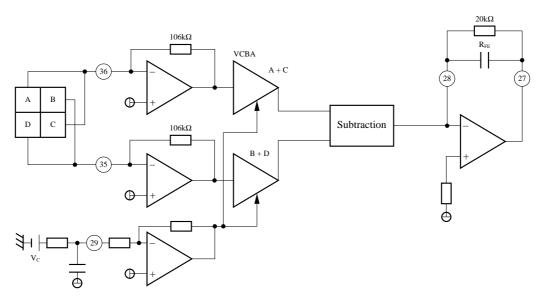

Figure 2: Focus Error Amplifier

The VCBA is for focus balance adjustment. Connecting  $47k\Omega$  of an external resistance to Pin29, signal ratio between A+C and B+D can be controlled as shown in Table 1.

Table	1	

$V_{\rm C}$	$\frac{A+C}{B+D}$	$\frac{B+D}{A+C}$
1.5V	0.14	7.0
2.5V	1.0	1.0
3.5V	7.0	0.14

## • Tracking Error Amplifier

As shown in Figure 3, the tracking error amplifier receives the output currents E and F of three-beam method pin photo diode for sub-beam detection, and outputs the operation result of E-F to TEOUT (Pin25).

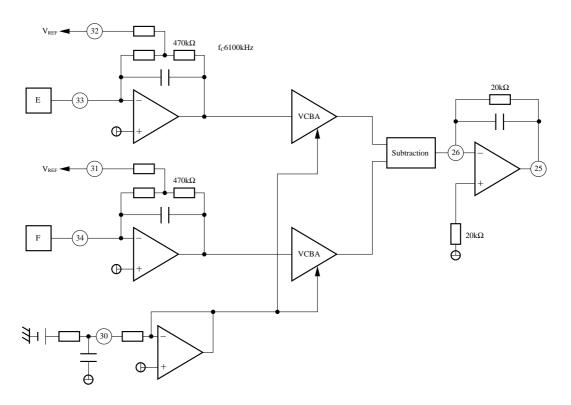

Figure 3: Tracking Error Amplifier

Pins31 and 32 are used to make the resistance converting the current to voltage variable. When these pins are directly connected to  $V_{REF}$  and  $20k\Omega$  of resistance is connected between TE and TE-, and between TE and TEOUT respectively, equivalent resistance to TEOUT is  $629k\Omega$ .

Table 2

$V_{\rm C}$	E/F	F/E
1.5V	0.14	7.0
2.5V	1.0	1.0
3.5V	7.0	0.14

The VCBA is for tracking balance adjustment in the same way of for focus. Table 2 shows the tracking balance ratio under the same conditions as shown in Table 1.

#### AGC

In order to absorb the attenuation of RF signal by disk, pick-up dispersion, finger print and other factors, AGC circuit for RF is incorporated.

The input impedance of Pin8 is approx.  $27.9k\Omega$ . ByPin10 (ARF), the gain-controlled RF-signal is outputted. Input allowable level is approx.  $1V_{P-P} \sim 500 mV_{P-P} \sim 250 mV_{P-P}$ , and output is  $1V_{P-P}$ . Pin9 is a connecting pin with capacity for constructing the AGC loop filter, and it is recommended that the external capacitor of  $1\mu F$  around should be connected to it for  $V_{CC}$ .

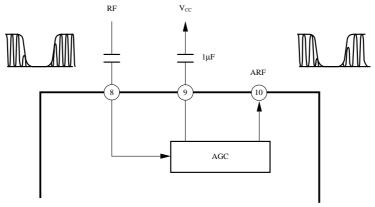

Figure 4 : AGC

## RFDET

The RFDET detects amplitude of RF signal inputted to Pin8. Threshold value is approx. 100mV (f = 500kHz), and RF Present = L, RF Absent = H are outputted.

### BDO Detection

BDO is detected by the low speed detection circuit and high speed detection circuit. The high speed detection circuit is incorporated. On the other hand, the capacitor of the low speed detection circuit must be connected to Pin13. The capacity value is 2200pF and it is recommended that it should be connected for  $V_{CC}$ . When this capacity value of Pin13 is increased, BDO is detected with large RF missing rate. When it is decreased, BDO can be detected with small RF missing rate.

 $BDO\ present = H \\ BDO\ absent = L$ 

#### OFTR Detection

OFTR detection reversely corresponds with BDO detection. However, its detection method is the same as for BDO. Capacitor for the low speed detection must be connected to Pin15. It is recommended that it should be connected to  $V_{CC}$  at 2200pF in the same way as for Pin13. The relation between the capacity value and OFTR detection timing is as the same for BDO.

OFTR=H
Off from OFTR=L

#### APC

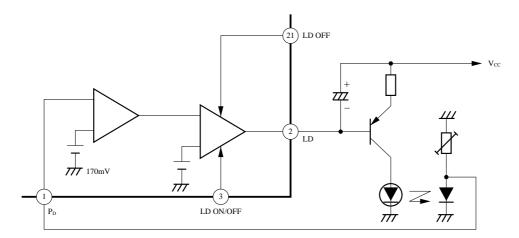

Figure 5 : APC

The reference voltage of LD is approx. 170mV fixed.

## • Reference Supply

Servo reference supply is incorporated. Pin20 outputs  $V_{CC}/2$ , and has approx. 3mA of current capacity for sink/source. It is recommended that it should be given  $1\mu F$  to  $10\mu F$  of capacity in addition.

## Vibration Detection

The AN8808SB has a wind comparator of approx.  $\pm 75$ mV. Abnormal vibration components of tracking error are detected and the data for whether vibration is present or not is outputted to Pin22.

## Envelope Detection

The envelope detection circuit extracts fluctuation of RF signal required for adjustment of focus balance.

Pins11 and 12 are connecting pins with capacity for constructing the filter. It is recommended that for Pin11, a capacitor of 100pF around, and for Pin12, an external capacitor of  $0.027\mu F$  around should be connected against  $V_{CC}$ .

Pin19 is for output and must have external capacity for constructing the filter, and it is recommended that an external capacitor of  $0.027\mu F$  around should be connected to it for  $V_{REF}$ 

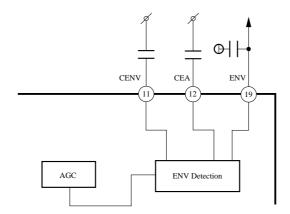

Figure 6: Envelope Detection

### CROSS Detection

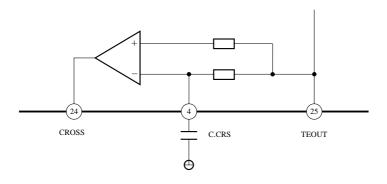

Figure 7: CROSS Detection

Track cross signals are detected from tracking error output. Pin4 is a connecting pin for constructing the filter, and it is recommended that a capacitor of  $2.2\mu F$  around should be connected to it for  $V_{REF}$ .
