

QUAD DARLINGTON SWITCH

- FOUR NON INVERTING INPUTS WITH ENABLE
- OUTPUT VOLTAGE UP TO 50 V
- OUTPUT CURRENT UP TO 1.8 A
- VERY LOW SATURATION VOLTAGE
- TTL COMPATIBLE INPUTS
- INTEGRAL FAST RECIRCULATION DIODES

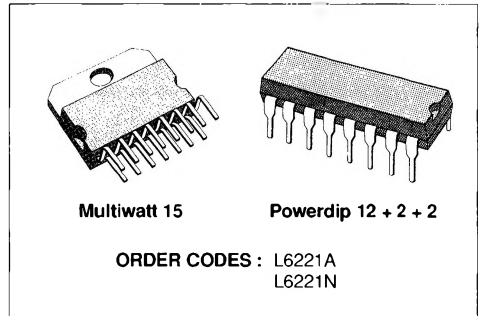

switches are commoned. Any number of inputs and outputs of the same device may be paralleled.

Two versions are available : the L6221A mounted in a Powerdip 12 + 2 + 2 package and the L6221N mounted in a 15-lead Multiwatt package.

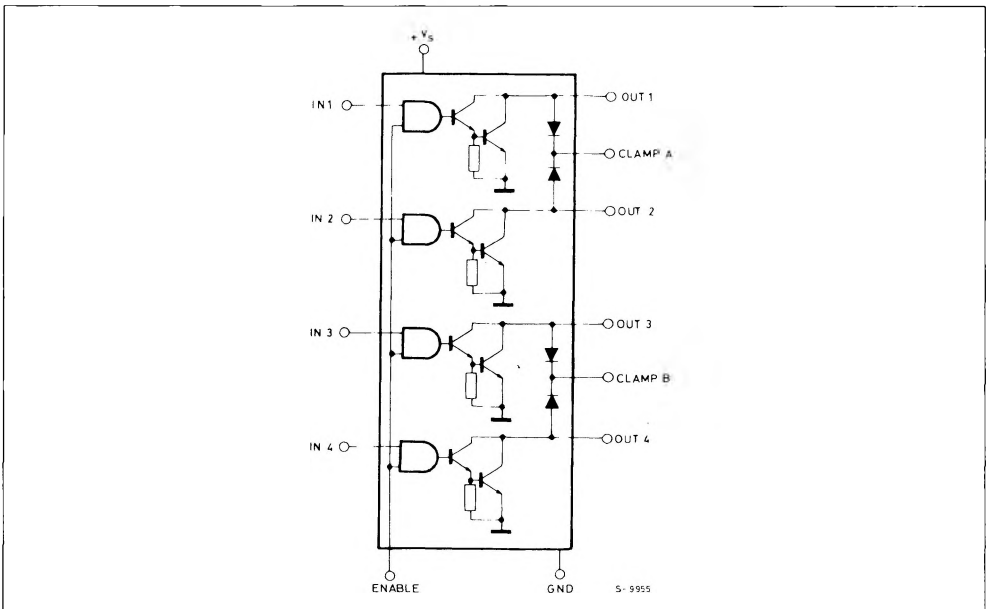

DESCRIPTION

The L6221 monolithic quad darlington switch is designed for high current, high voltage switching applications. Each of the four switches is controlled by a logic input and all four are controlled by a common enable input. All inputs are TTL-compatible for direct connection to logic circuits.

Each switch consists of an open-collector darlington transistor plus a fast diode for switching applications with inductive device loads. The emitters of the four

APPLICATION INFORMATION

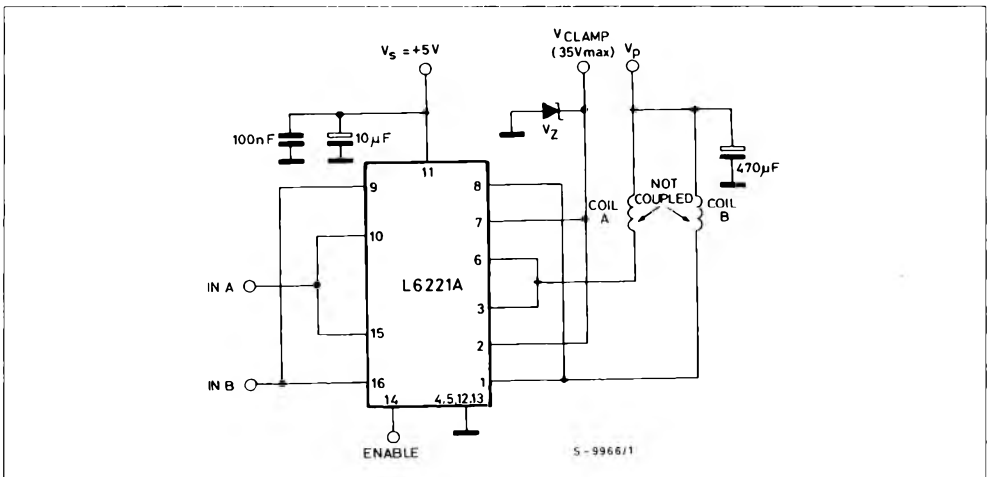

When inductive loads are driven by L6221A/N, a zener diode in series with the integral free-wheeling diodes increases the voltage across which energy stored in the load is discharged and therefore speeds the current decay (fig. 18).

For reliability it is suggested that the zener is chosen so that $V_p + V_z < 35 \text{ V}$.

The reasons for this are two fold :

- 1) The zener voltage changes in temperature and current.
- 2) The instantaneous power must be limited to avoid the reverse second breakdown.

Figure 19 : Driver for Solenoids up to 3A.

Some care must be taken to ensure that the collectors are placed close together to avoid different current partitioning at turn-off.

We suggest to put in parallel channel 1 and 4 and channel 2 and 3 as shown in figure 19 for the simi-

lar electrical characteristics of the logic section (turn-on and turn-off delay time) and the power stages (collector saturation voltage, free-wheeling diode forward voltage).

MOUNTING INSTRUCTION

The $R_{th\ j-amb}$ of the L6221A can be reduced by soldering the GND pins to a suitable copper area of the printed circuit board (Fig. 23) or to an external heatsink (Fig. 24).

The diagram of figure 25 shows the maximum dissipable power P_{tot} and the $R_{th\ j-amb}$ as a function of the side " α " of two equal square copper areas having a thickness of 35μ (1.4 mils). During soldering the pins temperature must not exceed $260\text{ }^{\circ}\text{C}$ and the soldering time must not be longer than 12 seconds.

Figure 23 : Example of P.C. Board Copper Area Which is Used as Heatsink.

Figure 25 : Maximum Dissipable Power and Junction to Ambient Thermal Resistance vs. Side " α ".

The external heatsink or printed circuit copper area must be connected to electrical ground.
