### Notes

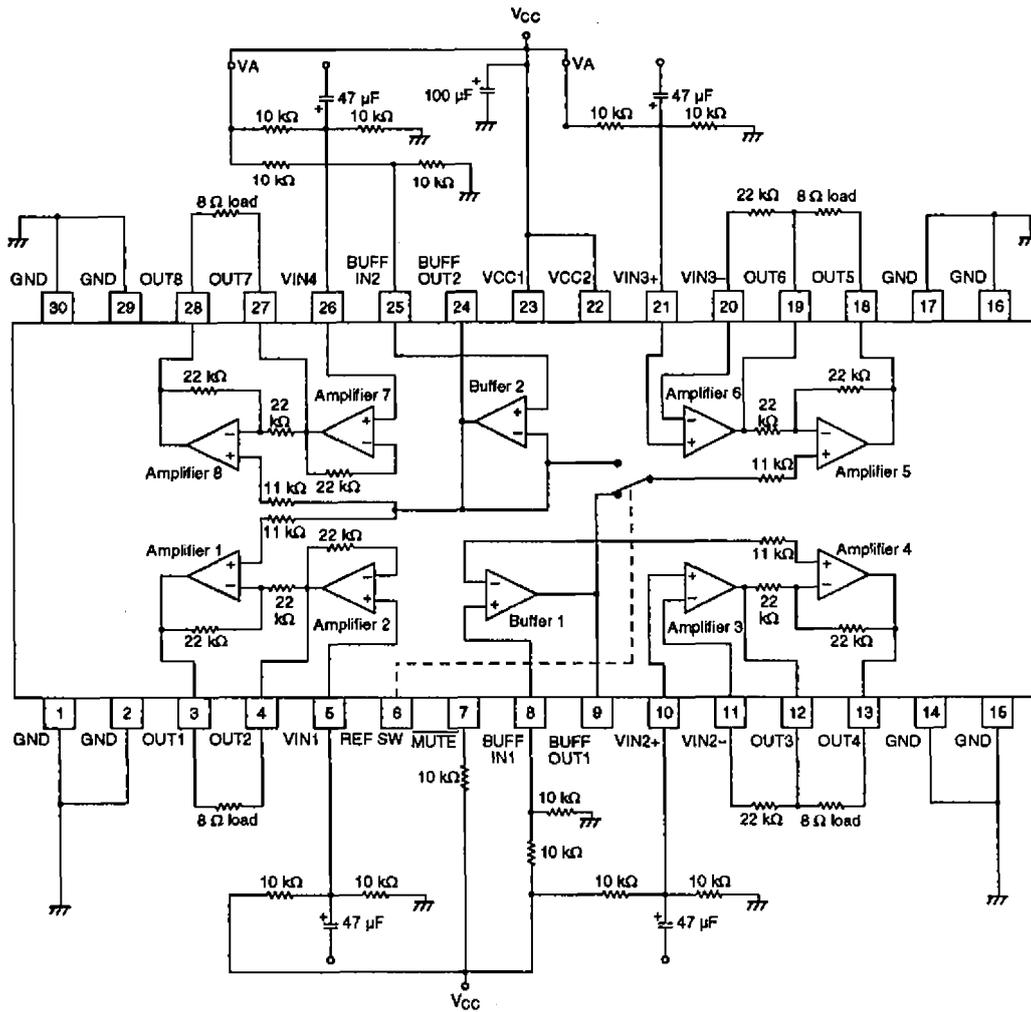

1. Amplifier non-inverting inputs are held at 0.5 V and amplifier inverting inputs are connected to outputs through a 22 k $\Omega$  resistor.
2. Output-to-ground voltage when an 8  $\Omega$  load is connected between a pair of bridge amplifier outputs.
3. Voltage differential between a pair of bridge amplifier outputs
4. Amplifier non-inverting input is connected to 0.5V<sub>CC</sub> through a 100 k $\Omega$  resistor, inverting input is connected to output through a 100 k $\Omega$  resistor. The current is determined from the voltage across the resistors.
