

## LM4884 Boomer® Audio Power Amplifier Series 2.1W Differential Input, BTL Output Stereo Audio Amplifier with RF Suppression and Shutdown

Check for Samples: [LM4884](#)

### FEATURES

- Improved RF immunity, by up to 28dB over previous designs (such as the LM4874) in selected applications.
- Fully differential input and output
- Internal gain set: 6dB, 10dB, 15.6dB, and 21.6dB
- Improved "click and pop" suppression
- Thermal shutdown protection circuit

- Ultra low current micropower shutdown mode
- 3.0V to 5.5V operation
- Available in space-saving exposed-DAP TSSOP package

### APPLICATIONS

- Notebook computers
- PDAs
- Portable electronic devices

### DESCRIPTION

The LM4884 features differential stereo inputs, BTL (bridge-tied load) outputs, and four externally selectable fixed gains.

The LM4884 also features proprietary internal circuitry that suppresses the coupling of RF signals into the chip. This is important because certain types of RF signals (such as GSM) can couple into audio amplifiers in such a way that part of the signal is heard through the speaker. The RF suppression circuitry in the LM4884 makes it well-suited for notebook and portable applications in which strong RF signals generated by an antenna from a PC wireless card or a cellular phone may couple audibly into the amplifier.

Operating on a single 5V supply, the LM4884 delivers 1.2W, 1.9W, or 2.1W (typ) of output power to an 8Ω, 4Ω, or 3Ω BTL load (Note 1), respectively, with less than 1% THD+N. The LM4884's gain is selected using two digital inputs. The nominal gain values are 6dB, 10dB, 15.6dB, and 21.6dB.

Other features of the LM4884 are that it delivers high-quality output power from a surface-mount package, requires few external components, has an active-low micropower shutdown mode input, and has thermal shutdown protection.

**Table 1. Key Specifications**

	VALUE	UNIT
■ BTL output power $R_L = 3\Omega$ , $V_{DD} = 5.0V$ , and THD+N = 1%	2.1	W (typ)
■ BTL output power $R_L = 4\Omega$ , $V_{DD} = 5.0V$ , and THD+N = 1%	1.9	W (typ)
■ BTL output power $R_L = 8\Omega$ , $V_{DD} = 5.0V$ , and THD+N = 1%	1.2	W (typ)
■ Micropower shutdown current	0.1	μA (typ)
■ PSRR ( @ 1kHz, $V_{DD} = 5V$ , (Fig.1))	62	dB (typ)

## Typical Application

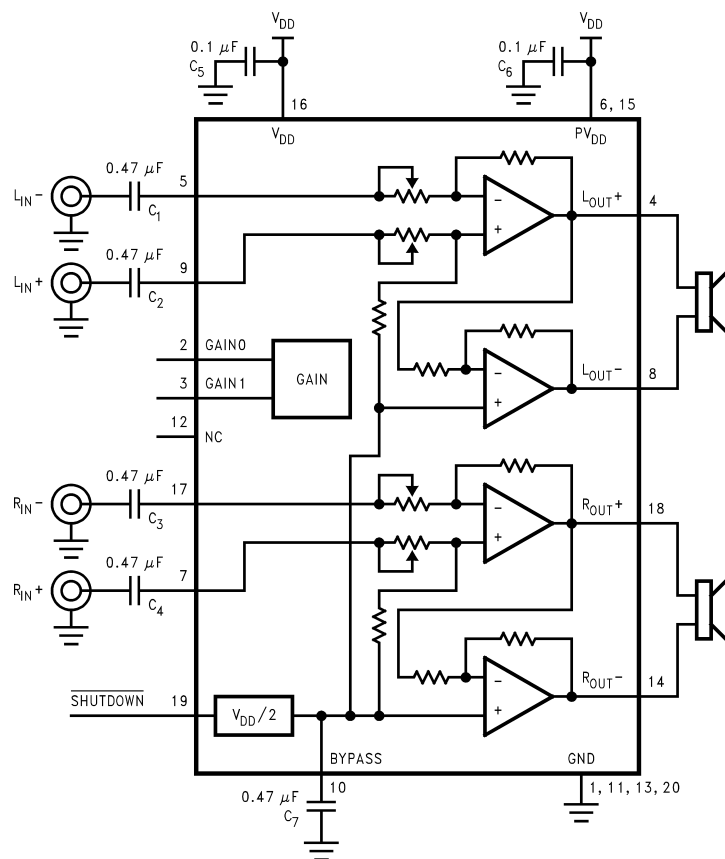

Figure 2. Typical Audio Amplifier Application Circuit

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

**Absolute Maximum Ratings** <sup>(1) (2)</sup>

Supply Voltage	6.0V
Storage Temperature	-65°C to + 150°C
Input Voltage	-0.3V to V <sub>DD</sub> + 0.3V
Power Dissipation <sup>(3)</sup>	Internally Limited
ESD Susceptibility <sup>(4)</sup>	2000V
ESD Susceptibility <sup>(5)</sup>	200V
Junction Temperature	150°C
Soldering Information Small Outline Package Vapor Phase (60 sec.)	215°C
Infrared (15 sec.)	220°C
See AN-450 "Surface Mounting and their Effects on Product Reliability" for other methods of soldering surface mount devices.	
Thermal Resistance	
θ <sub>JC</sub> (typ) MXA20A	2°C/W
θ <sub>JA</sub> (typ) MXA20A	41°C/W <sup>(6)</sup>

- (1) All voltages are measured with respect to the GND pin unless other wise specified.
- (2) Absolute Maximum Ratings indicate limits beyond which damage to the device may occur. Operating Ratings indicate conditions for which the device is functional but do not guarantee specific performance limits. Electrical Characteristics state DC and AC electrical specifications under particular test conditions that guarantee specific performance limits. This assumes that the device is within the Operating Ratings. Specifications are not guaranteed for parameters where no limit is given, however, the typical value is a good indication of device performance.
- (3) The maximum power dissipation must be derated at elevated temperatures and is dictated by T<sub>JMAX</sub>, θ<sub>JA</sub>, and the ambient temperature, T<sub>A</sub>. The maximum allowable power dissipation is P<sub>DMAX</sub> = (T<sub>JMAX</sub> - T<sub>A</sub>)/θ<sub>JA</sub> or the number given in Absolute Maximum Ratings, whichever is lower. For the LM4884, see power derating currents for more information.
- (4) Human body model, 100 pF discharged through a 1.5 kΩ resistor.
- (5) Machine Model, 220pF-240pF discharged through all pins.
- (6) The given θ<sub>JA</sub> is for an LM4884 packaged in an MXA20A with the exposed-DAP soldered to an exposed 2in<sup>2</sup> area of 1oz printed circuit board copper. When driving 4Ω loads from a 5V supply, the LM4884MH must be mounted to the circuit board and its exposed-DAP soldered to an exposed 2in<sup>2</sup> area of 1oz PCB copper.

**Operating Ratings**

Temperature Range T <sub>MIN</sub> ≤ T <sub>A</sub> ≤ T <sub>MAX</sub>	-40°C ≤ T <sub>A</sub> ≤ 85°C
Supply Voltage	3.0 V ≤ V <sub>DD</sub> ≤ 5.5V

## Electrical Characteristics for LM4884 (1) (2)

The following specifications applies to the LM4884 when used in the circuit shown in Figure 1 and operating with  $V_{DD} = 5V$  and  $A_V = 6dB$ , unless otherwise specified. Limits apply for  $T_A = 25^\circ C$ .

Symbol	Parameter	Conditions	LM4884		Units (Limits)
			Typical (2)	Limit (3) (4)	
$V_{DD}$	Supply Voltage			3.0 5.5	V (min) V (max)
$I_{DD}$	Quiescent Power Supply Current	$V_{IN} = 0V, I_O = 0A, R_L = \infty$	9.0	12.0	mA (max)
$I_{SD}$	Shutdown Current	$V_{shutdown} = GND$	0.1	1.0	$\mu A$ (max)
$V_{OS}$	Output Offset Voltage		7	50	mV (max)
PSRR	Output Supply Rejection Ratio	$V_{DD} = 5V, V_{RIPPLE} = 200mV_{P-P}$ sinewave, $C_{BYPASS} = 0.47\mu F$ , $R_L = 8\Omega$	62		dB
$P_O$	Output Power (Note 11)	THD+N = 1% (max), $f = 1kHz$ (Note12) $R_L = 3\Omega$ $R_L = 4\Omega$ $R_L = 8\Omega$	2.1	1.0	W
			1.9		W
			1.2		W (min)
		THD+N = 10% (max), $f = 1kHz$ (Note12) $R_L = 3\Omega$ $R_L = 4\Omega$ $R_L = 8\Omega$	2.6	W	
			2.3	W	
			1.5	W	
THD+N	Total Harmonic Distortion + Noise	$20Hz \leq f \leq 20kHz$ $R_L = 4\Omega, P_O = 2W$ $R_L = 8\Omega, P_O = 1W$	0.3 0.3		% %
S/N	Signal-to-Noise Ratio	$f = 1kHz, C_{BYPASS} = 0.47\mu F$ , $P_O = 1.1W, R_L = 8\Omega$	97		dB
$R_{IN}$	Input Resistance	Pins 5, 7, 9, and 17	See Table 1.		

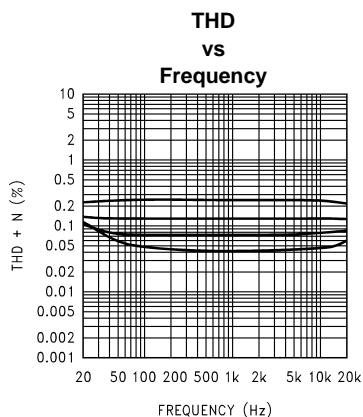

- (1) All voltages are measured with respect to the GND pin unless other wise specified.
- (2) Typicals are measured at  $25^\circ C$  and represent the parametric norm.
- (3) Limits are guaranteed to National's AOQL (Average Outgoing Quality Level).
- (4) Datasheet minimum and maximum specification limits are guaranteed by design, test, or statistical analysis.

## External Components Description

See [Figure 2](#).

Components		Functional Description
1.	$C_i$	The input coupling capacitor blocks DC voltage at the amplifier's inverting input terminals. $C_i$ , along with the LM4884's variable input resistance $R_1$ (See Table 1), creates a highpass filter with $f_C = 1/(2\pi R_1 C_i)$ . Both inverting and noninverting inputs require a $C_i$ . Refer to the Application Information section, <b>SELECTING EXTERNAL COMPONENTS</b> , for an explanation of determining the value of $C_i$ .
2.	$C_S$	The supply bypass capacitor. Refer to the <b>POWER SUPPLY BYPASSING</b> section for information about properly placing, and selecting the value of, this capacitor.
3.	$C_B$	The capacitor, $C_B$ , filters the half-supply voltage present on the BYPASS pin. Refer to the Application Information section, <b>SELECTING EXTERNAL COMPONENTS</b> , for information concerning proper placement and selecting $C_B$ 's value.

### Typical Performance Characteristics

## Application Information

### OPTIMIZING RF IMMUNITY

The internal circuitry of the LM4884 suppresses the amount of RF signal that is coupled into the chip. However, certain external factors, such as output trace length, output trace orientation, distance between the chip and the antenna, antenna strength, speaker type, and type of RF signal, may affect the RF immunity of the LM4884. In general, the RF immunity of the LM4884 is application specific. Nevertheless, optimal RF immunity can be achieved by using short output traces and increasing the distance between the LM4884 and the antenna.

### PCB LAYOUT AND SUPPLY REGULATION CONSIDERATIONS FOR DRIVING 3W AND 4W LOADS

Power dissipated by a load is a function of the voltage swing across the load and the load's impedance. As load impedance decreases, load dissipation becomes increasingly dependent on the interconnect (PCB trace and wire) resistance between the amplifier output pins and the load's connections. Residual trace resistance causes a voltage drop, which results in power dissipated in the trace and not in the load as desired. For example, 0.1Ω trace resistance reduces the output power dissipated by a 4Ω load from 2.1W to 2.0W. This problem of decreased load dissipation is exacerbated as load impedance decreases. Therefore, to maintain the highest load dissipation and widest output voltage swing, PCB traces that connect the output pins to a load must be as wide as possible.

Poor power supply regulation also adversely affects maximum output power. A poorly regulated supply's output voltage decreases with increasing load current. Reduced supply voltage causes decreased headroom, output signal clipping, and reduced output power. Even with tightly regulated supplies, trace resistance creates the same effects as poor supply regulation. Therefore, making the power supply traces as wide as possible helps maintain full output voltage swing.

### BRIDGE CONFIGURATION EXPLANATION

As shown in Figure 1, each of the LM4884's stereo channels consists of two operational amplifiers. The LM4884 can be used to drive a speaker connected between the two outputs of each channel's amplifiers.

Figure 1 shows that the output of Amp1 serves as the input to Amp2, which results in both amplifiers producing signals identical in magnitude, but 180° out of phase. Taking advantage of this phase difference, a load is placed between OUT+ and OUT- and driven differentially (commonly referred to as "bridge mode"). This results in a differential gain of

$$A_{VD} = 2(R_F/R_I) \quad (1)$$

Bridge mode is different from single-ended amplifiers that drive loads connected between a single amplifier's output and ground. For a given supply voltage, bridge mode has a distinct advantage over the single-ended configuration: its differential output doubles the voltage swing across the load. This results in four times the output power when compared to a single-ended amplifier under the same conditions. This increase in attainable output assumes that the amplifier is not current limited or the output signal is not clipped. To ensure minimum output signal clipping when selecting one of the amplifier's four closed-loop gains, refer to the **Audio Power Amplifier Design** section.

Another advantage of the differential bridge output is no net DC voltage across the load. This results from biasing OUT+ and OUT- at half-supply. This eliminates the coupling capacitor that single supply, single-ended amplifiers require. Eliminating an output coupling capacitor in a single-ended configuration forces a single supply amplifier's half-supply bias voltage across the load. The current flow created by the half-supply bias voltage increases internal IC power dissipation and may permanently damage loads such as speakers.

### POWER DISSIPATION

Power dissipation is a major concern when designing a successful bridged or single-ended amplifier. Equation (2) states the maximum power dissipation point for a single-ended amplifier operating at a given supply voltage and driving a specified output load.

$$P_{D_{MAX}} = (V_{DD})^2 / (2\pi^2 R_L) \quad \text{Single-Ended} \quad (2)$$

However, a direct consequence of the increased power delivered to the load by a bridge amplifier is an increase in the internal power dissipation point for a bridge amplifier operating at the same given conditions.

$$P_{\text{DMAX}} = 4 * (V_{\text{DD}})^2 / (2\pi^2 R_L) \quad \text{Bridge Mode} \quad (3)$$

The LM4884 has four operational amplifiers in one package and the maximum internal power dissipation is four times that of a single-ended amplifier. From Equation (3), assuming a 5V power supply and an 8Ω load, the maximum power dissipation point is 2W. The maximum power dissipation point obtained from Equation (3) must not exceed the power dissipation predicted by Equation (4):

$$P_{\text{DMAX}} = (T_{\text{JMAX}} - T_A) / \theta_{\text{JA}} \quad (4)$$

For the exposed DAP TSSOP package,  $\theta_{\text{JA}} = 41^\circ\text{C/W}$ .  $T_{\text{JMAX}} = 150^\circ\text{C}$  for the LM4884. For a given ambient temperature  $T_A$ , Equation (4) can be used to find the maximum internal power dissipation supported by the IC packaging. If the result of Equation (3) is greater than that of Equation (4), decrease the supply voltage, increase the load impedance, or reduce the ambient temperature. For a typical application with a 5V power supply and an 8Ω load, the maximum ambient temperature that does not violate the maximum junction temperature is approximately 68°C. This further assumes that a device is a surface mount part operating around the maximum power dissipation point. Since internal power dissipation is a function of output power, higher ambient temperatures are allowed as output power decreases. Refer to the Typical Performance Characteristics curves for power dissipation information at lower output power levels.

## BTL GAIN SELECTION

The LM4884 features four fixed, internally set, BTL voltage gains: 6dB, 10dB, 15.6dB, and 21.6dB. Select one of the four gains by applying a logic level signal to the GAIN0 (MSB) and GAIN1 (LSB) digital inputs.

The closed-loop gain of the first amplifier is adjustable, having four different gains, whereas two internal 20kΩ resistors set the second amplifier's gain at -1. Table 1 below, shows the state of the two logic inputs required to select one of the four gain values.

**Table 2. Gain Settings and Input Resistance**

GAIN 0	GAIN 1	Selected Gain (dB)	Input Resistance (R <sub>i</sub> )
0	0	6	90kΩ
0	1	10	70kΩ
1	0	15.6	45kΩ
1	1	21.6	25kΩ

## POWER SUPPLY BYPASSING

As with any power amplifier, proper supply bypassing is critical for low noise performance and high power supply rejection. The capacitors connected to the bypass and power supply pins should be placed as close to the LM4884 as possible. The capacitor connected between the bypass pin and ground improves the internal bias voltage's stability, producing improved PSRR. The improvements to PSRR increase as the bypass pin capacitor value increases.

Typical applications employ a 5V regulator with 10μF and a 0.1μF filter capacitors that aid in supply stability. Their presence, however, does not eliminate the need for bypassing the LM4884's supply pins. The selection of bypass capacitor values, especially  $C_B$ , depends on desired PSRR requirements, click and pop performance (as explained in the **Selecting External Components** section), system cost, and size constraints.

## MICRO-POWER SHUTDOWN

The LM4884 features an active-low micro-power shutdown mode. The voltage applied to the SHUTDOWN pin controls the LM4884's shutdown function. Activate micro-power shutdown by applying 0V to the SHUTDOWN pin. The logic threshold is typically 0.4V for a logic low and 1.5V for a logic high. When active, the LM4884's micro-power shutdown feature turns off the amplifier's bias circuitry, disables the internal  $V_{DD}/2$  generator, and forces the amplifier outputs into a high impedance state. The result is greatly reduced power supply current. The low 0.1 $\mu$ A typical shutdown current is achieved by applying a voltage to the SHUTDOWN pin that is as near to GND as possible. A voltage that is greater than GND may increase the shutdown current.

There are a few methods to control the micro-power shutdown. These include using a single-pole, single-throw switch (SPST), a microprocessor, or a microcontroller. When using a switch, connect a 100k $\Omega$  pull-down resistor between the SHUTDOWN pin and GND and the SPST switch between the SHUTDOWN pin and  $V_{DD}$ . Select normal amplifier operation by closing the switch. Opening the switch applies GND to the SHUTDOWN pin, activating micro-power shutdown. The switch and resistor guarantee that the SHUTDOWN pin will not float. This prevents unwanted state changes. In a system with a microprocessor or a microcontroller, use a digital output to apply the active-state voltage to the SHUTDOWN pin. Driving the SHUTDOWN pin with active circuitry eliminates the pull-down resistor.

**Table 3. Logic Level Truth Table for Shutdown Operation**

SHUTDOWN	OPERATIONAL MODE
High	Full Power, stereo BTL amplifiers
Low	Micro-power Shutdown

## SELECTING PROPER EXTERNAL COMPONENTS

Optimizing the LM4884's performance requires properly selecting external components. Though the LM4884 operates well when using external components with wide tolerances, best performance is achieved by optimizing component values. The LM4884 is unity-gain stable, giving a designer maximum design flexibility. The gain should be set to no more than a given application requires. This allows the amplifier to achieve minimum THD+N and maximum signal-to-noise ratio. These parameters are compromised as the closed-loop gain increases. However, low gain demands input signals with greater voltage swings to achieve maximum output power. Fortunately, many signal sources such as audio CODECs have outputs of 1V<sub>RMS</sub> (2.83V<sub>P-P</sub>). Please refer to the Audio Power Amplifier Design section for more information on selecting the proper gain.

### *Input Capacitor Value Selection*

Amplifying the lowest audio frequencies requires high value input coupling capacitors ( $C_1$ ,  $C_2$  and  $C_3$ ,  $C_4$ ) in Figure 1. A high value capacitor can be expensive and may compromise space efficiency in portable designs. In many cases, however, the speakers used in portable systems, whether internal or external, have little ability to reproduce signals with frequencies below 150Hz. Applications using speakers with this limited frequency response reap little improvement by using large input capacitor.

Besides effecting system cost and size,  $C_1$  -  $C_4$  can also affect on the LM4884's turn-on and turn-off transient ("click and pop") performance. When the supply voltage is first applied, a transient may be created as the charge on the input capacitor changes from zero to a quiescent state. The magnitude of the transient is proportional to the value of, and more importantly, the mismatch between, the capacitors connected to a given pair of inverting and non-inverting inputs. The better the match, the less the transient magnitude.

Higher value capacitors need more time to reach a quiescent DC voltage (usually  $V_{DD}/2$ ) when charged with a fixed current. This fixed current is supplied through amplifiers input pins. Thus, selecting an input capacitor value that is no higher than necessary to meet the desired -3dB frequency will reduce turn-on time and help ensure that transients are minimized.

The LM4884's nominal input resistance ( $R_i$ ) is 25k $\Omega$  (20k $\Omega$ , minimum) and the input capacitor,  $C_i$ , form high pass filter with a -3dB low frequency limit defined by equation (5).

$$f_{-3dB} = 1/2\pi(25k\Omega)C_i \quad (5)$$

As an example when using a speaker with a low frequency limit of 150Hz,  $C_i$  is  $0.047\mu\text{F}$ . The  $0.47\mu\text{F}$   $C_i$  shown in Figure 1 allows the LM4884 to drive high efficiency, full range speaker whose response extends below 30Hz.

### Bypass Capacitor Value Selection

Besides optimizing the input capacitor value, careful consideration should be paid to value of  $C_B$ , the capacitor connected between the BYPASS pin and ground. Since  $C_B$  determines how fast the LM4884 settles to its quiescent operating state, its value is critical when minimizing turn-on transients. The slower the LM4884's outputs ramp to their quiescent DC voltage (nominally  $\frac{1}{2} V_{DD}$ ), the smaller the turn-on transient. Choosing  $C_B$  equal to  $0.47\mu\text{F}$  along with a small value of  $C_i$  (in the range of  $0.047\mu\text{F}$  to  $0.47\mu\text{F}$ ), produces a transient-free turn-on and shutdown function. As discussed above, choosing  $C_i$  no larger than necessary for the desired bandwidth helps minimize turn-on transients.

### OPTIMIZING OUTPUT TRANSIENT REDUCTION (CLICK AND POP PERFORMANCE)

The LM4884 contains circuitry to minimize turn-on and shutdown transients or 'clicks and pop'. For this discussion, turn-on refers to either applying the power supply voltage or when the shutdown mode is deactivated. While the power supply voltage is ramping to its final value, the LM4884's internal amplifiers are configured as unity gain buffers. An internal current source changes the voltage of the BYPASS pin in a controlled, linear manner. Ideally, the amplifier inputs and outputs track the voltage applied to the BYPASS pin. The gain of the internal amplifiers remains unity until the voltage on the bypass pin reaches  $\frac{1}{2} V_{DD}$ . As soon as the voltage on the BYPASS pin is stable, the device becomes fully operational. Although the bypass pin current can not be modified, changing the size of  $C_B$  alters the device's turn-on time and the magnitude of output transients. Increasing the value of  $C_B$  reduces the magnitude of turn-on transients. However, this presents a tradeoff: as the size of  $C_B$  increases, the turn-on time increases. There is a linear relationships between the size of  $C_B + 2(C_i)$  and the turn-on time. The table shows some typical turn-on times for various values of  $C_B$ :

$C_B$	Ton	
	$C_i = 0.47\mu\text{F}$	$C_i = 0.33\mu\text{F}$
0.01 $\mu\text{F}$	110ms	80ms
0.1 $\mu\text{F}$	120ms	90ms
0.22 $\mu\text{F}$	140ms	100ms
0.47 $\mu\text{F}$	170ms	140ms
1.0 $\mu\text{F}$	240ms	210ms

In order to eliminate 'clicks and pops', all capacitors must be discharged before turn-on. Rapidly switching  $V_{DD}$  may not allow the capacitors to fully discharge, which may cause 'clicks and pops'.

### AUDIO POWER AMPLIFIER DESIGN

#### Audio Amplifier Design: Driving 1W into an 8 $\Omega$ Load

The following are the desired operational parameters:

<b>Power Output:</b>	<b>1 W<sub>RMS</sub></b>
Load Impedance:	8 $\Omega$
Input Level:	1 V <sub>RMS</sub>
Input Impedance:	20 k $\Omega$
Bandwidth:	100 Hz–20 kHz $\pm$ 0.25 dB

The design begins by specifying the minimum supply voltage necessary to obtain the desired output power. One way to find the minimum supply voltage is to use the Output Power vs Supply Voltage curve in the **Typical Performance Characteristics** section. Another way, using Equation (6), is to calculate the peak output voltage necessary to achieve the desired output power for a given load impedance. To account for the amplifier's dropout voltage, two additional volt-ages, based on the Dropout Voltage vs Supply Voltage in the **Typical Performance Characteristics** curves, must be added to the result obtained by Equation (6). The result is Equation (7).

$$V_{\text{outpeak}} = \sqrt{(2R_L P_O)} \quad (6)$$

$$V_{DD} \geq (V_{\text{OUTPEAK}} + (V_{\text{ODTOP}} + V_{\text{ODBOT}})) \quad (7)$$

The Output Power vs Supply Voltage graph for an 8Ω load indicates a minimum supply voltage of 4.6V. This is easily met by the commonly used 5V supply voltage. The additional voltage creates the benefit of headroom, allowing the LM4884 to produce peak output power in excess of 1W without clipping or other audible distortion. The choice of supply voltage must also not create a situation that violates of maximum power dissipation as explained above in the **Power Dissipation** section.

After satisfying the LM4884's power dissipation requirements, the minimum differential gain is found using Equation (8).

$$A_{VD} \geq \sqrt{(P_O R_L)} / (V_{IN}) = V_{\text{orms}} / V_{\text{inrms}} \quad (8)$$

Thus, a minimum gain of 2.83 allows the LM4884's to reach full output swing and maintain low noise and THD+N performance. For this example, let  $A_{VD} = 3$ . In the example design, the gain will be set to 10dB ( $A_{VD} = 3.2$ ) by applying a logic low to GAIN 0 and a logic high to GAIN 1.

The last step in this design example is setting the amplifier's -3dB frequency bandwidth. To achieve the desired ±0.25dB pass band magnitude variation limit, the low frequency response must extend to at least one-fifth the lower bandwidth limit and the high frequency response must extend to at least five times the upper bandwidth limit. This extended bandwidth produces a gain variation of -0.17dB at the bandwidth's limits, well within the ±0.25dB desired limit. The results are an

$$f_L = 100\text{Hz}/5 = 20\text{Hz} \quad (9)$$

and an

$$f_H = 20\text{kHz} \times 5 = 100\text{kHz} \quad (10)$$

As mentioned in the External Components section, the internal input resistor and  $C_i$  create a high pass filter that sets the amplifier's lower bandpass frequency limit. Find the coupling capacitor's value using Equation (11).

$$f_{-3\text{dB}} = 1/2\pi(20\text{k}\Omega)C_i \quad (11)$$

The result is (using the minimum  $R_{IN}$  resistor value to ensure correct magnitude response at 20Hz)

$$1/(2\pi * 20\text{k}\Omega * 20\text{Hz}) = 0.398\mu\text{F} \quad (12)$$

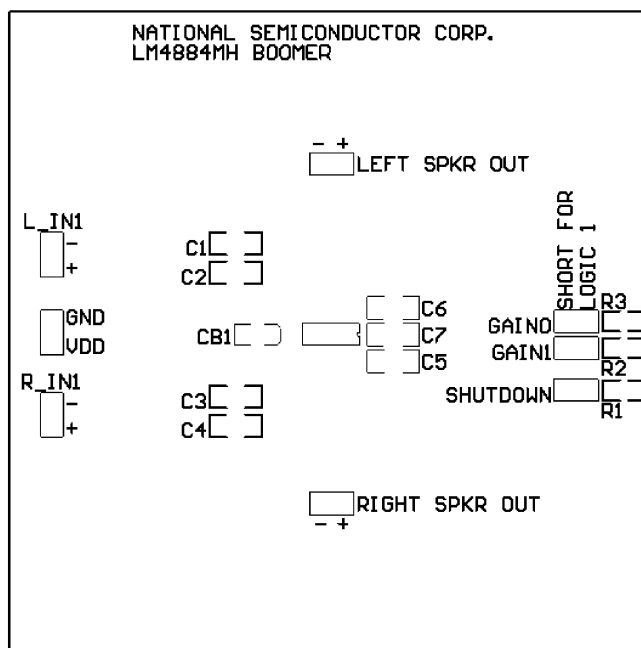

Use a 0.39 $\mu$ F capacitor, the closest standard value. The product of the desired high frequency cutoff (100kHz in this example) and the differential gain,  $A_{VD}$ , determines the upper passband response limit. With  $A_{VD} = 3.2$  and  $f_H = 100$ kHz, the closed-loop gain bandwidth product (GBWP) is 320kHz. This is less than the LM4884's 3.5MHz GBWP. With this margin, the amplifier can be used in designs that require more differential gain while avoiding performance-restricting bandwidth limitations.

### Recommended Printed Circuit Board Layout

Figures 2 through 6 show the recommended four-layer PC board layout that is optimized for the 20-pin MH-packaged LM4884 and associated external components. This circuit is designed for use with an external 5V supply and 3 $\Omega$  (or higher) speakers (or load resistors).

This circuit board is easy to use. Apply 5V and ground to the board's  $V_{DD}$  and GND terminals, respectively. Connect speakers (or load resistors) between the board's -OUTA and +OUTA and -OUTB and +OUTB pads. Apply balanced differential stereo input signals to the input pins labeled "-INA," "+INA," "-INB," and "+INB."

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
