

LP265/LP365 Micropower Programmable Quad Comparator

General Description

The LP365 consists of four independent voltage comparators. The comparators can be programmed, four at the same time, for various supply currents, input currents, response times and output current drives. This is accomplished by connecting a single resistor between the V_{CC} and I_{SET} pins.

These comparators can be operated from split power supplies or from a single power supply over a wide range of voltages. The input can sense signals at ground level even with single supply operation. The unique output NPN transistor stages are uncommitted to either power supply. They can be connected directly to various logic system supplies so that they are highly flexible to interface with various logic families.

Application areas include battery power circuits, threshold detectors, zero crossing detectors, simple serial A/D converters, VCO, multivibrators, voltage converters, power sequencers, and high performance V/F converters, and RTD linearization.

Features

- Single programming resistor to tailor power consumption, input current, speed and output current drive capability
- Wide single supply voltage range or dual supplies (4 V_{DC} to 36 V_{DC} or $\pm 2.0 V_{DC}$ to $\pm 18 V_{DC}$)
- Low supply current drain (10 μA) and low power consumption (10 μW /comparator) @ $I_{SET} = 0.5 \mu A$
 $V_{CC} = 5V_{DC}$
- Uncommitted output stage—selectable output levels
- Output directly compatible with DTL, TTL, CMOS, MOS or other special logic families
- Input common-mode range includes ground
- Differential input voltage equal to the power supply voltage

Typical Connection

TL/H/5023-1

Programming Equation

$$I_{SET} = \frac{(V^+) - (V^-) - 1.3V}{R_{SET}}$$

$$I_{SUPPLY} \approx 22 \times I_{SET}$$

Connection Diagram

Order Number LP365M, LP265N, LP365AN or LP365N
See NS Package Numbers M16A or N16A

Absolute Maximum Ratings

If Military/Aerospace specified devices are required, please contact the National Semiconductor Sales Office/Distributors for availability and specifications.

Supply Voltage	36 V _{DC} or ± 18 V _{DC}
Differential Input Voltage	± 36 V _{DC}
Input Voltage (Note 1)	−0.3V to +36 V _{DC}
Output Short Circuit to V _E (Note 2)	Continuous
V _{OUT} with Respect to V _E	V _E − 7V ≤ V _{OUT} ≤ V _E + 36V
ESD Tolerance (Note 10)	2000V

	M Package	N Package
Power Dissipation (Note 3)	500 mW	500 mW
T _j Max	115°C	115°C
θ _{JA}	115°C/W	90°C/W
Lead Temp.		260°C
(Soldering—10 sec.)		
(Vapor Phase—60 sec.)	215°C	
(Infrared—15 sec.)	220°C	
Operating Temp. Range LP365:	0°C ≤ T _A ≤ +70°C	
LP265:	−40°C ≤ T _A ≤ +85°C	
Storage Temp. Range	−40°C ≤ T _A ≤ +150°C	

Electrical Characteristics (Note 4) Low power V_S = 5V, I_{SET} = 10 μA

I_{LEAK}	Output Leakage Current	$V_C = 15V$, $V_E = -15V$	5	50	5000	5	50	5000	nA (Max)
t_R	Response Time	$V_{CC} = 5V$, $V_E = 0V$, $R_L = 5k$, $C_L = 10 \text{ pF}$ (Note 7)	1.0			1.0			μs

Note 1: The input voltage is not allowed to go 0.3V above V^+ or -0.3V below V^- as this will turn on a parasitic transistor causing large currents to flow through the device.

Note 2: Short circuits from the output to V^+ may cause excessive heating and eventual destruction. The current in the output leads and the V_E lead should not be allowed to exceed 30 mA. The output should not be shorted to V^- if $V_E \leq (V^-) + 7V$.

Note 3: For operating at elevated temperatures, these devices must be derated based on a thermal resistance of θ_{JA} and T_J max. $T_J = T_A + \theta_{JA} P_D$.

Note 4: Boldface numbers apply at temperature extremes. All other numbers apply at $T_A = T_J = 25^\circ C$. $V^+ = 5V$, $V^- = 0V$, $I_{SET} = 10 \mu A$, $R_L = 100k$, and $V_C = 5V$ as shown in the Typical Connection diagram.

Note 5: Guaranteed and 100% production tested.

Note 6: Guaranteed (but not 100% production tested) over the operating temperature and supply voltage ranges. These limits are not used to calculate out-going quality levels.

Note 7: The response time specified is for a 100 mV input step with 5 mV overdrive.

Note 8: Boldface numbers apply at temperature extremes. All other numbers apply at $T_A = T_J = 25^\circ C$. $V^+ = +15V$, $V^- = -15V$, $I_{SET} = 100 \mu A$, $R_L = 100k$, and $V_C = 5V$ as shown in the Typical Connection diagram.

Note 9: See AN-450 "Surface Mounting Methods and Their Effect on Product Reliability" for other methods of soldering surface mount devices.

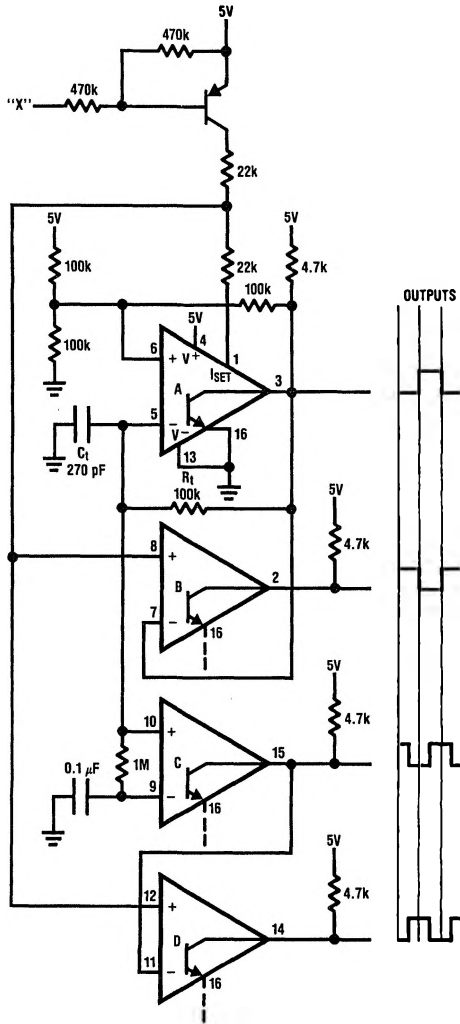

Note 10: Human body model, 1.5 k Ω in series with 100 pF.

Typical Performance Characteristics

Typical Applications

Gated 4-Phase Oscillator

TL/H/5023-4

$f = 20 \text{ kHz}$

$$f = \frac{1}{1.6 \cdot R_1 \cdot C_1}$$

All four phases run when X is low. When X is high, oscillation stops and power drain is zero.

"Voting" Comparator

TL/H/5023-5

If $V_E = 0.25V$, then V_{OUT} will be low if 1 of the 3 other outputs are low. Choice of $V_E = 0.50V$ causes V_{OUT} to be low if 2 of the 3 other outputs are low; $V_E = 0.75V$ will cause V_{OUT} to be low if all 3 other outputs are low.

Typical Applications (Continued)

Ordinary Hysteresis

TL/H/5023-6

It is a good practice to add a few millivolts of positive feedback to prevent oscillation when the input voltage is near the threshold.

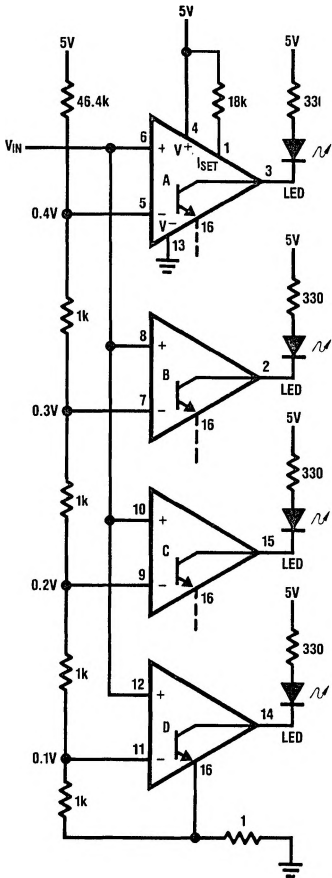

Hysteresis from Emitter

TL/H/5023-7

Positive feedback from the emitter can also prevent oscillations when V_{IN} is near the threshold.

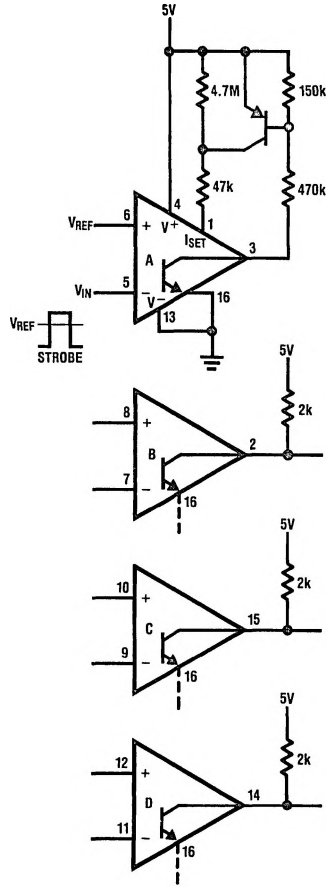

Bar-Graph Display

TL/H/5023-8

The positive feedback from pin 16 provides hysteresis.

Level-Sensitive Strobe

TL/H/5023-9

Comparators B, C, and D do not respond until activated by the signal applied to comparator A.

Typical Applications (Continued)

Slow Op Amp (Inverter)

TL/H/5023-10

$R_B = V^+ / 20 \mu A$

Unlike most comparators, the LP365 can be used as an op amp, if suitable R-C damping networks are used.

Slow Op Amp (Unity-Gain Follower)

TL/H/5023-11

$R_B = V^+ / 20 \mu A$

The LP365 can also be used as a high-input-impedance follower-amplifier with the damping components shown.

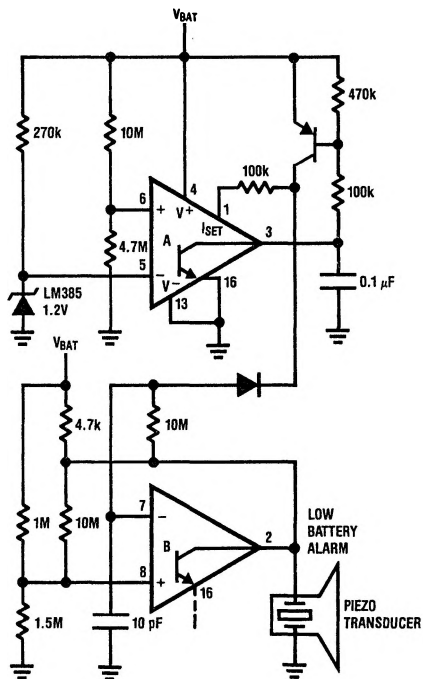

Chopping Outputs

TL/H/5023-12

Chopping the outputs by modulating the ISET current allows data to be transmitted via opto-couplers, transformers, etc.

Low Battery Detector

TL/H/5023-13

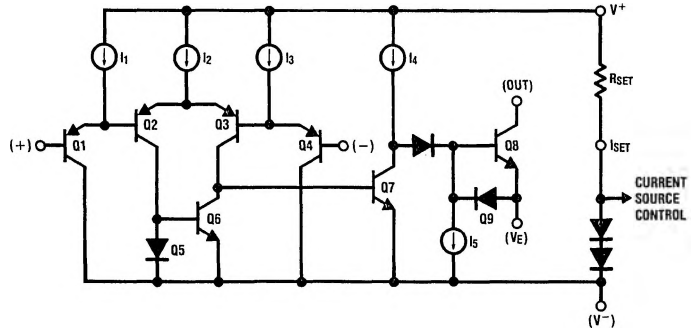

$I_S @ 6V = 45 \mu A$

$I_S @ 3.8V = 1 \mu A$

$f = 3 \text{ kHz}$

Comparator A detects when the supply voltage drops to 4V and enables comparator B to drive a piezoelectric alarm.

Simplified Schematic

Current sources are programmed by I_{SET}
 V_E is common to all 4 comparators

TL/H/5023-14
