## MSM82C51ARS/GS

UNIVERSAL SYNCHRONOUS ASYNCHRONOUS RECEIVER TRANSMITTER

### GENERAL DESCRIPTION

The MSM82C51A is a USART (Universal Synchronous Asynchronous Receiver Transmitter) for serial data communication.

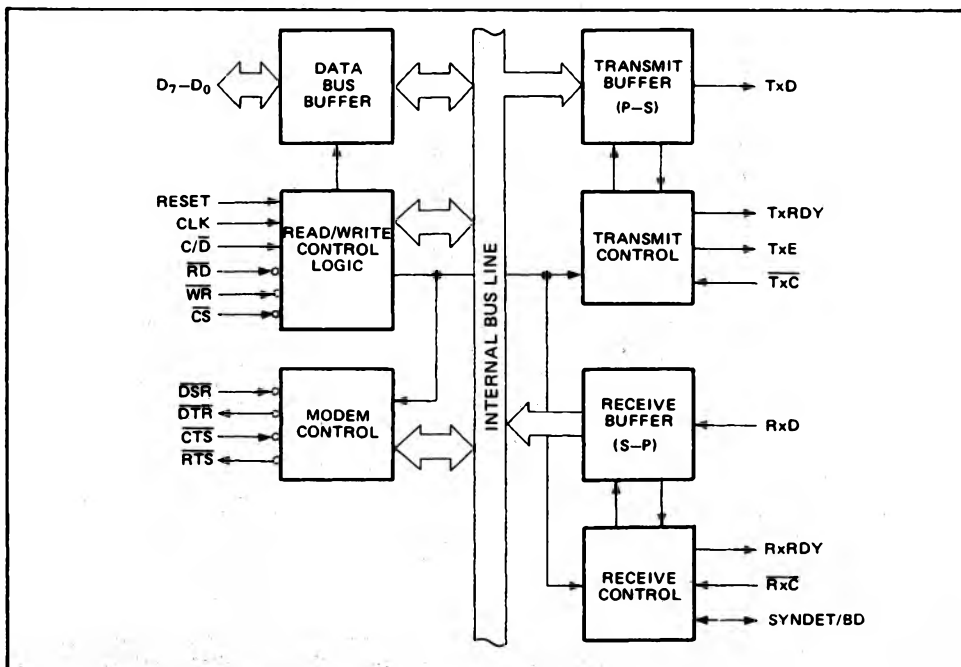

As a peripheral device of a microcomputer system the MSM82C51A receives parallel data from the CPU and transmits serial data after conversion. This device also receives serial data from the outside and transmits parallel data to the CPU after conversion.

The MSM82C51A configures a fully static circuit using silicon gate CMOS technology. Therefore, it operates on extremely low power at 100  $\mu$ A (max) of standby current by suspending all operations.

### FEATURES

- Wide power supply voltage range from 3 V to 6 V.
- Wide temperature range from  $-40^{\circ}\text{C}$  to  $85^{\circ}\text{C}$ .
- Synchronous communication upto 64K baud.
- Asynchronous communication upto 38.4K baud.
- Transmitting/receiving operations under double buffered configuration.
- Error detection (parity, overrun and framing)
- 28-pin DIP (MSM82C51ARS)
- 32-pin flat package (MSM82C51AGS)

### FUNCTIONAL BLOCK DIAGRAM

## PIN CONFIGURATION

## FUNCTION

### Outline

The MSM82C51A's functional configuration is programmed by software.

Operation between the MSM82C51A and a CPU is executed by program control. Table 1 shows the operation between a CPU and the device.

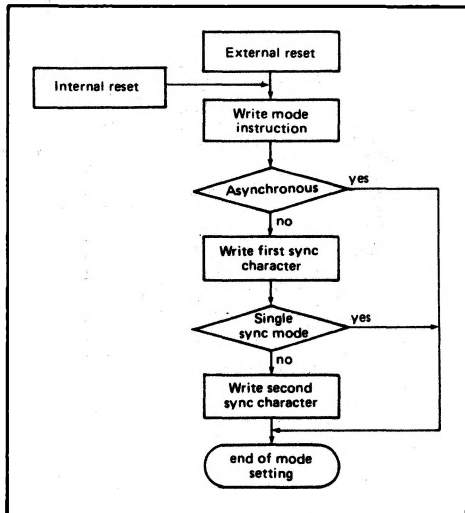

**Table 1 Operation between MSM82C51A and CPU**

$\overline{CS}$	C/D	$\overline{RD}$	WR	
1	X	X	X	Data bus 3-state
0	X	1	1	Data bus 3-state
0	1	0	1	Status → CPU
0	1	1	0	Control word ← CPU
0	0	0	1	Data → CPU
0	0	1	0	Data ← CPU

It is necessary to execute a function-setting sequence after resetting the MSM82C51A. Fig. 1 shows the function-setting sequence.

If the function was set, the device is ready to receive a command, thus enabling the transfer of data.

by setting a necessary command, reading a status and reading/writing data.

**Fig. 1 Function-Setting Sequence (Mode Instruction Sequence)**

# Control Words

There are two types of control word.

1. Mode instruction (setting of function)
2. Command (setting of operation)

## 1) Mode Instruction

Mode instruction is used for setting the function of the MSM82C51A. Mode instruction will be in "wait for write" at either internal reset or external reset. That is, the writing of a control word after resetting will be recognized as a "mode instruction."

Items set by mode instruction are as follows:

- Synchronous/asynchronous mode

- Stop bit length (asynchronous mode)
- Character length
- Parity bit
- Baud rate factor (asynchronous mode)
- Internal/external synchronization (synchronous mode)
- No. of synchronous characters (synchronous mode)

The bit configuration of mode instruction is shown in Fig.'s 2 and 3. In the case of synchronous mode, it is necessary to write one- or two-byte sync characters.

If sync characters were written, a function will be set because the writing of sync characters constitutes part of mode instruction.

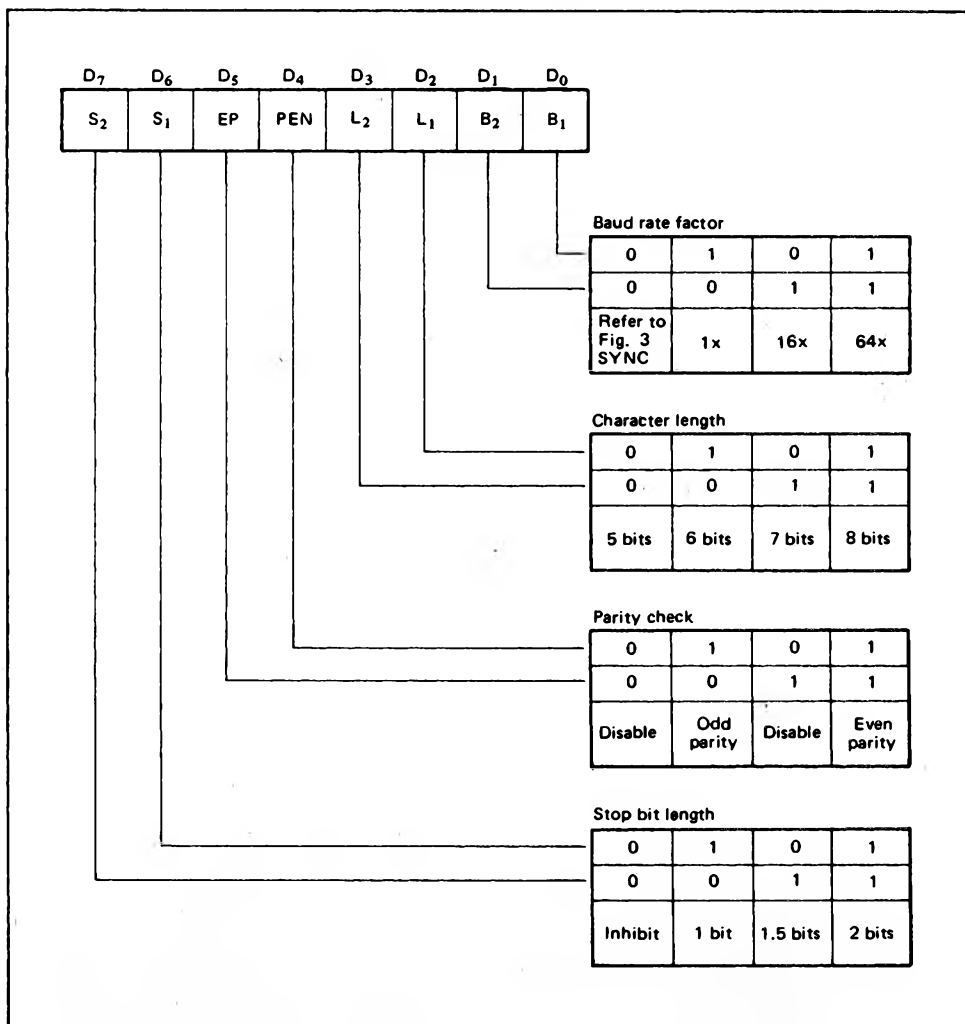

Fig. 2 Bit Configuration of Mode Instruction (Asynchronous)

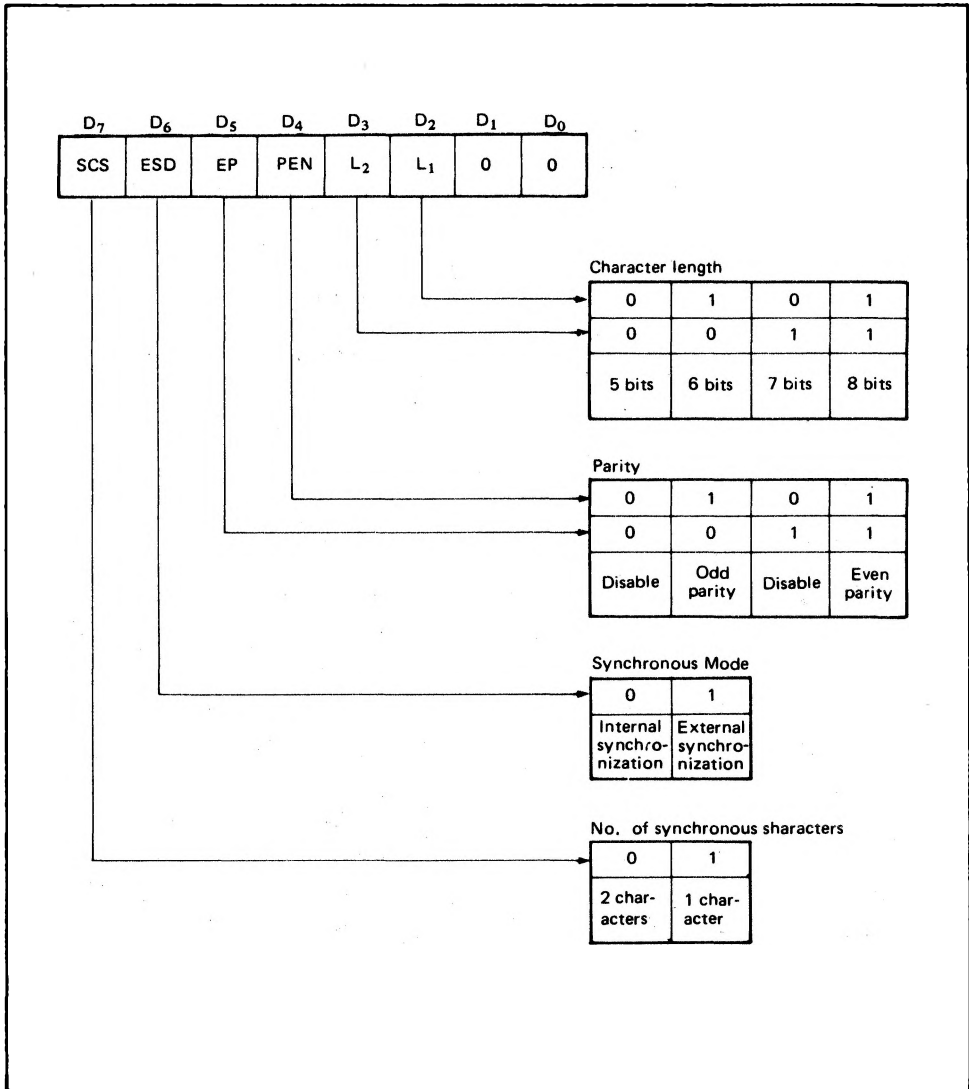

Fig. 3 Bit Configuration of Mode Instruction (Synchronous)

## 2) Command

Command is used for setting the operation of the MSM82C51A.

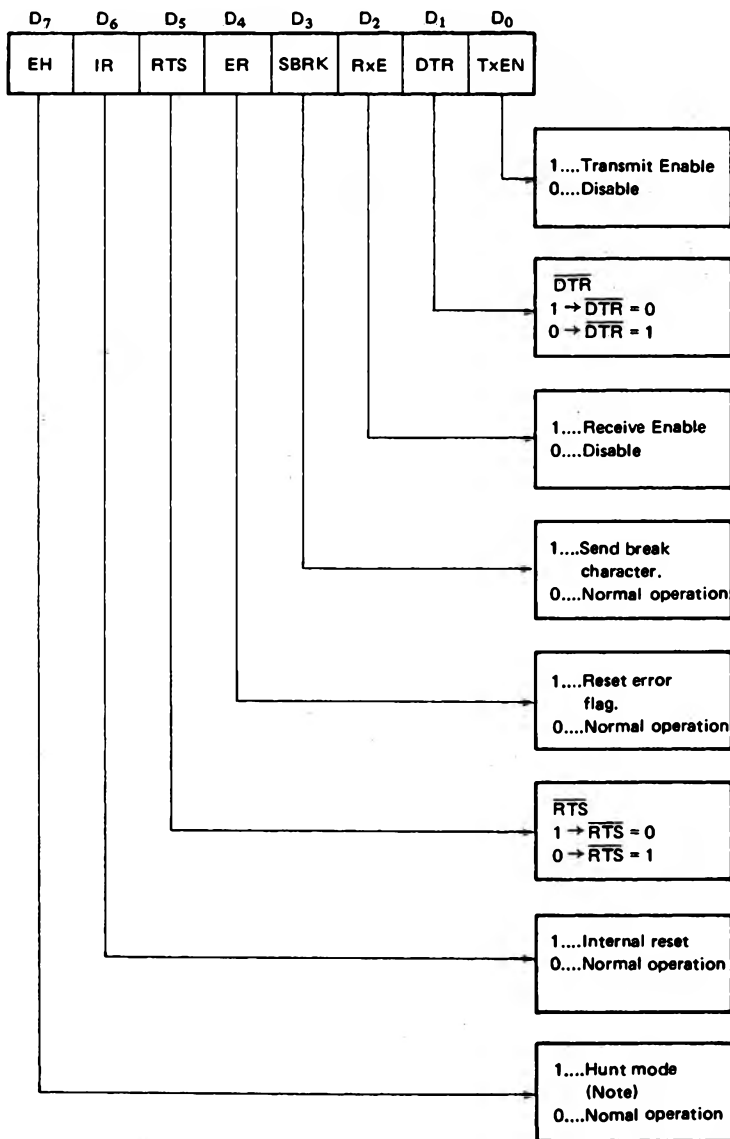

It is possible to write a command whenever necessary after writing a mode instruction and sync characters.

Items to be set by command are as follows:

- Transmit Enable/Disable

- Receive Enable/Disable
- DTR, RTS Output of data.
- Resetting of error flag.
- Sending of break characters
- Internal resetting
- Hunt mode (synchronous mode)

The bit configuration of a command is shown in Fig. 4.

(Note) Search mode for synchronous characters in synchronous mode.

Fig. 4 Bit Configuration of Command

# Status Word

It is possible to see the internal status of MSM-82C51A by reading a status word.

The bit configuration of status word is shown in Fig. 5.

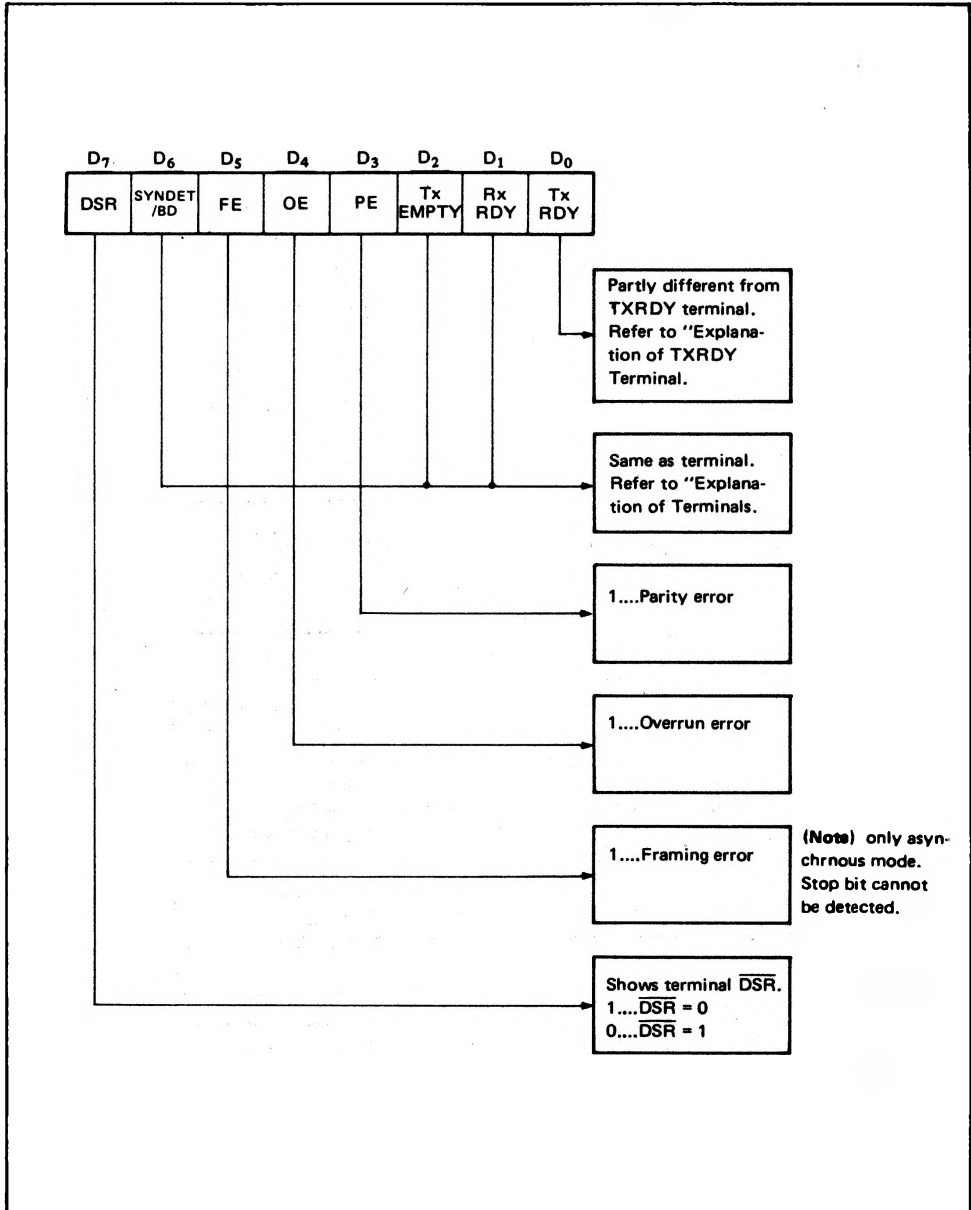

Fig. 5 Bit Configuration of Status Word

### Standby Status

It is possible to put the MSM82C51A in "standby status".

When the following conditions have been satisfied the MSM82C51A is in "standby status."

- (1) CS terminal is fixed at Vcc level.
- (2) Input pins other than  $\overline{CS}$ ,  $D_0$  to  $D_7$ ,  $\overline{RD}$ ,  $\overline{WR}$  and  $C/\overline{D}$  are fixed at Vcc or GND level (including SYNDEN in external synchronous mode).

Note When all output currents are 0, ICCS specification is applied.

### Pin Descriptions

#### $D_0$ to $D_7$ (I/O terminal)

This is bidirectional data bus which receive control words and transmits data from the CPU and sends status words and received data to CPU.

#### RESET (Input terminal)

A "High" on this input forces the MSM82C51A into "reset status."

The device waits for the writing of "mode instruction."

The min. reset width is six clock inputs during the operating status of CLK.

#### CLK (Input terminal)

CLK signal is used to generate internal device timing.

CLK signal is independent of  $\overline{RXC}$  or  $\overline{TXC}$ .

However, the frequency of CLK must be greater than 30 times the  $\overline{RXC}$  and  $\overline{TXC}$  at Synchronous mode and Asynchronous "x1" mode, and must be greater than 5 times at Asynchronous "x16" and "x64" mode.

#### $\overline{WR}$ (Input terminal)

This is the "active low" input terminal which receives a signal for writing transmit data and control words from the CPU into the MSM82C51A.

#### $\overline{RD}$ (Input terminal)

This is the "active low" input terminal which receives a signal for reading receive data and status words from the MSM82C51A.

#### $C/\overline{D}$ (Input terminal)

This is an input terminal which receives a signal for selecting data or command words and status words when the MSM82C51A is accessed by the CPU.

If  $C/\overline{D}$  = low, data will be accessed.

If  $C/\overline{D}$  = high, command word or status word will be accessed.

#### $\overline{CS}$ (Input terminal)

This is the "active low" input terminal which selects the MSM82C51A at low level when the CPU accesses.

Note The device won't be in "standby status"; only setting  $\overline{CS}$  = High.

Refer to "Explanation of Standby Status."

### TXD (Output terminal)

This is an output terminal for transmitting data from which serial-converted data is sent out.

The device is in "mark status" (high level) after resetting or during a status when transmit is disabled.

It is also possible to set the device in "break status" (low level) by a command.

### TXRDY (Output terminal)

This is an output terminal which indicates that the MSM82C51A is ready to accept a transmitted data character. But the terminal is always at low level if CTS high or the device was set in "TX disable status" by a command.

Note TXRDY status word indicates that transmit data character is receivable, regardless of CTS or command.

If the CPU writes a data character, TXRDY will be reset by the leading edge or  $\overline{WR}$  signal.

### TXEMPTY (Output terminal)

This is an output terminal which indicates that the MSM82C51A has transmitted all the characters and had no data character.

In "synchronous mode," the terminal is at high level, if transmit data characters are no longer remaining and sync characters are automatically transmitted.

If the CPU writes a data character, TXEMPTY will be reset by the leading edge of  $\overline{WR}$  signal.

Note As the transmitter is disabled by setting CTS "High" or command, data written before disable will be sent out. Then TXD and TXEMPTY will be "High".

Even if a data is written after disable, that data is not sent out and TXE will be "High". After the transmitter is enabled, it sent out.

(Refer to Timing Chart of Transmitter Control and Flag Timing)

### $\overline{TXC}$ (Input terminal)

This is a clock input signal which determines the transfer speed of transmitted data.

In "synchronous mode," the baud rate will be the same as the frequency of  $\overline{TXC}$ .

In "asynchronous mode", it is possible to select the baud rate factor by mode instruction.

It can be 1, 1/16 or 1/64 the  $\overline{TXC}$ .

The falling edge of  $\overline{TXC}$  shifts the serial data out of the MSM82C51A.

### RXD (Input terminal)

This is a terminal which receives serial data.

### RXRDY (Output terminal)

This is a terminal which indicates that the MSM82C51A contains a character that is ready to READ.

If the CPU reads a data character, RXRDY will be reset by the leading edge of  $\overline{RD}$  signal.

Unless the CPU reads a data character before the next one is received completely, the preceding data will be lost. In such a case, an overrun error flag status word will be set.

**RXC** (Input terminal)

This is a clock input signal which determines the transfer speed of received data.

In "synchronous mode," the baud rate is the same as the frequency of RXC.

In "asynchronous mode," it is possible to select the baud rate factor by mode instruction.

It can be 1, 1/16, 1/64 the RXC.

**SYNDET/BD** (Input or output terminal)

This is a terminal whose function changes according to mode.

In "internal synchronous mode," this terminal is at high level, if sync characters are received and synchronized. If a status word is read, the terminal will be reset.

In "external synchronous mode," this is an input terminal.

A "High" on this input forces the MSM82C51A to start receiving data characters.

In "asynchronous mode," this is an output terminal which generates "high level" output upon the detection of a "break" character if receiver data contains a "low-level" space between the stop bits of two continuous characters. The terminal will be reset, if RXD is at high level.

**DSR** (Input terminal)

This is an input port for MODEM interface. The input status of the terminal can be recognized by the CPU reading status words.

**DTR** (Output terminal)

This is an output port for MODEM interface. It is possible to set the status of DTR by a command.

**CTS** (Input terminal)

This is an input terminal for MODEM interface which is used for controlling a transmit circuit. The terminal controls data transmission if the device is set in "TX Enable" status by a command. Data is transmittable if the terminal is at low level.

**RTS** (Output terminal)

This is an output port for MODEM interface. It is possible to set the status of RTS by a command.

## ABSOLUTE MAXIMUM RATINGS

Parameter	Symbol	Limits		Unit	Conditions
		MSM82C51ARS	MSM82C51AGS		
Power supply voltage	$V_{CC}$	$-0.5 \sim +7$		V	With respect to GND
Input voltage	$V_{IN}$	$-0.5 \sim V_{CC} + 0.5$		V	
Output voltage	$V_{OUT}$	$-0.5 \sim V_{CC} + 0.5$		V	
Storage temperature	$T_{stg}$	$-55 \sim 150$		°C	—
Power dissipation	$P_D$	0.9	0.7	W	$T_a = 25^\circ\text{C}$

## OPERATING RANGE

Parameter	Symbol	Limits	Unit
Power supply voltage	$V_{CC}$	$3 \sim 6$	V
Operating temperature	$T_{OP}$	$-40 \sim 85$	°C

## RECOMMENDED OPERATING CONDITIONS

Parameter	Symbol	Min.	Typ.	Max.	Unit
Power supply voltage	$V_{CC}$	4.5	5	5.5	V
Operating temperature	$T_{OP}$	-40	+25	+85	°C
"L" input voltage	$V_{IL}$	-0.3		+0.8	V
"H" input voltage	$V_{IH}$	2.2		$V_{CC} + 0.3$	V

## DC CHARACTERISTICS

(V<sub>CC</sub> = 4.5 ~ 5.5V T<sub>a</sub> = -40°C ~ +85°C)

Parameter	Symbol	Min.	Typ.	Max.	Unit	Measurement Conditions
"L" output voltage	$V_{OL}$			0.45	V	$I_{OL} = 2\text{ mA}$
"H" output voltage	$V_{OH}$	3.7			V	$I_{OH} = -400\text{ }\mu\text{A}$
Input leak current	$I_{LI}$	-10		10	$\mu\text{A}$	$0 \leq V_{IN} \leq V_{CC}$
Output leak current	$I_{LO}$	-10		10	$\mu\text{A}$	$0 \leq V_{OUT} \leq V_{CC}$
Operating supply current	$I_{CCO}$			5	mA	Asynchronous X64 during transmitting/receiving
Standby supply current	$I_{CCS}$			100	$\mu\text{A}$	All input voltage shall be fixed at V <sub>CC</sub> or GND level.

## AC CHARACTERISTICS

(V<sub>CC</sub> = 4.5 ~ 5.5V, T<sub>a</sub> = -40 ~ 85°C)

## CPU Bus Interface Part

Parameter	Symbol	Min.	Max.	Unit	Remarks
Address stable before $\overline{RD}$	$t_{AR}$	20		NS	Note 2
Address hold time for $\overline{RD}$	$t_{RA}$	20		NS	Note 2
$\overline{RD}$ pulse width	$t_{RR}$	250		NS	
Data delay from $\overline{RD}$	$t_{RD}$		200	NS	
$\overline{RD}$ to data float	$t_{DF}$	10	100	NS	
Recovery time between $\overline{RD}$	$t_{RVR}$	6		T <sub>cy</sub>	Note 5
Address stable before $\overline{WR}$	$t_{AW}$	20		NS	Note 2
Address hold time for $\overline{WR}$	$t_{WA}$	20		NS	Note 2
$\overline{WR}$ pulse width	$t_{WW}$	250		NS	
Data set-up time for $\overline{WR}$	$t_{DW}$	150		NS	
Data hold time for $\overline{WR}$	$t_{WD}$	20		NS	
Recovery time between $\overline{WR}$	$t_{RVW}$	6		T <sub>cy</sub>	Note 4
RESET pulse width	$t_{RESW}$	6		T <sub>cy</sub>	

## Serial Interface Part

Parameter	Symbol	Min.	Max.	Unit	Remarks
Main clock period	$t_{cy}$	250		NS	Note 3
Clock low time	$t_{\phi}$	90		NS	
Clock high time	$t_{\phi}$	120	$t_{cy}-90$	NS	
Clock rise/fall time	$t_R, t_F$		20	NS	
TXD delay from falling edge of $\overline{TXC}$	$t_{DTX}$		1	$\mu$ S	
Transmitter clock frequency	1X Baud	$f_{TX}$	DC	64	Note 3
	16X, Baud	$f_{TX}$	DC	615	
	64X, Baud	$f_{TX}$	DC	615	
Transmitter clock low time	1X Baud	$t_{TPW}$	13	T <sub>cy</sub>	
	16X, 64X Baud	$t_{TPW}$	2	T <sub>cy</sub>	
Transmitter clock high time	1X Baud	$t_{TPD}$	15	T <sub>cy</sub>	
	16X, 64X Baud	$t_{TPD}$	3	T <sub>cy</sub>	
Receiver clock frequency	1X Baud	$f_{RX}$	DC	64	Note 3
	16X Baud	$f_{RX}$	DC	615	
	64X Baud	$f_{RX}$	DC	615	
Receiver clock low time	1X Baud	$t_{RPW}$	13	T <sub>cy</sub>	
	16X, 64X Baud	$t_{RPW}$	2	T <sub>cy</sub>	
Receiver clock high time	1X Baud	$t_{RPD}$	15	T <sub>cy</sub>	
	16X, 64X Baud	$t_{RPD}$	3	T <sub>cy</sub>	
Time from the center of last bit to the rise of TXRDY	$t_{TXRDY}$		8	T <sub>cy</sub>	
Time from the leading edge of $\overline{WR}$ to the fall of TXRDY	$t_{TXRDY\ CLEAR}$		400	NS	
Time from the center of last bit to the rise of RXRDY	$t_{RXRDY}$		26	T <sub>cy</sub>	

Parameter	Symbol	Min.	Max.	Unit	Remarks
Time from the leading edge of $\overline{RD}$ to the fall of RXRDY	$t_{RXRDY\ CLEAR}$		400	NS	
Internal SYNDET delay time from rising edge of RXC	$t_{IS}$		26	$T_{cy}$	
SYNDET setup time for $\overline{RXC}$	$t_{ES}$	18		$T_{cy}$	
TXE delay time from the center of last bit	$t_{TXEMPTY}$	20		$T_{cy}$	
MODEM control signal delay time from rising edge of $\overline{WR}$	$t_{WC}$	8		$T_{cy}$	
MODEM control signal setup time for falling edge of $\overline{RD}$	$t_{CR}$	20		$T_{cy}$	
RXD setup time for rising edge of $\overline{RXC}$ (1X Baud)	$t_{RXDS}$	11		$T_{cy}$	
RXD hold time for falling edge of $\overline{RXC}$ (1X Baud)	$t_{RXDH}$	17		$T_{cy}$	

- Caution**
- 1) AC characteristics are measured at 150 pF capacity load as an output load based on 0.8 V at low level and 2.2 V at high level for output and 1.5 V for input.
  - 2) Addresses are  $\overline{CS}$  and  $C/\overline{D}$ .
  - 3)  $f_{TX}$  or  $f_{RX} \leq 1/(30 T_{cy})$  1 x baud  
 $f_{TX}$  or  $f_{RX} \leq 1/(5 T_{cy})$  16 x, 64 x Baud
  - 4) This recovery time is mode initialization only. Recovery time between command writes for Asynchronous Mode is  $8 T_{cy}$  and for Synchronous Mode is  $18 T_{cy}$ .  
Write Data is allowed only when  $TXRDY = 1$ .
  - 5) This recovery time is Status read only.  
Read Data is allowed only when  $RXRDY = 1$ .
  - 6) Status update can have a maximum delay of 28 clock periods from event affecting the status.

## TIMING CHART

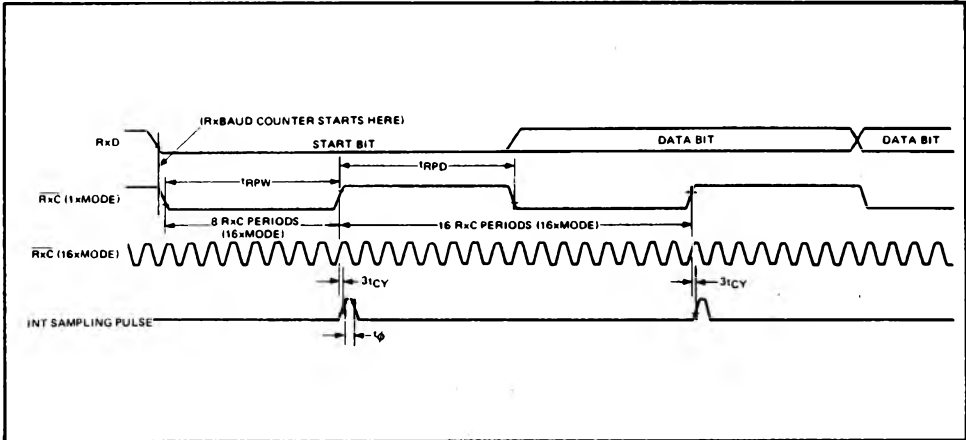

### System Clock Input

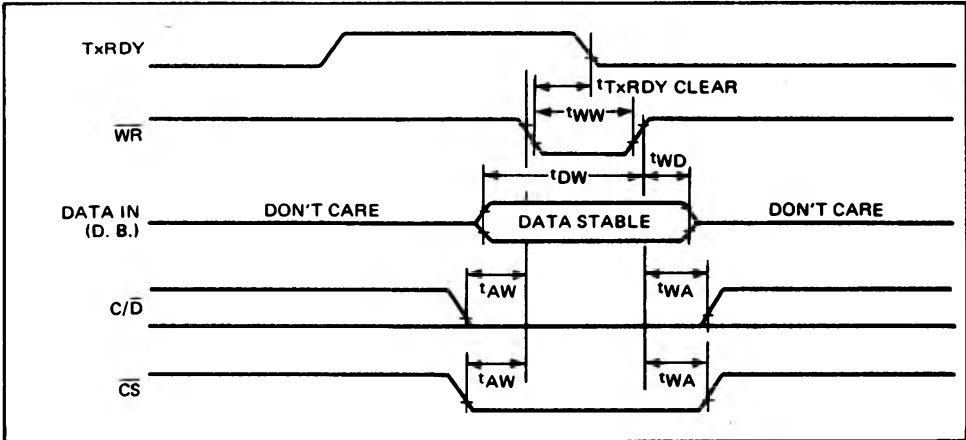

### Transmitter Clock and Data

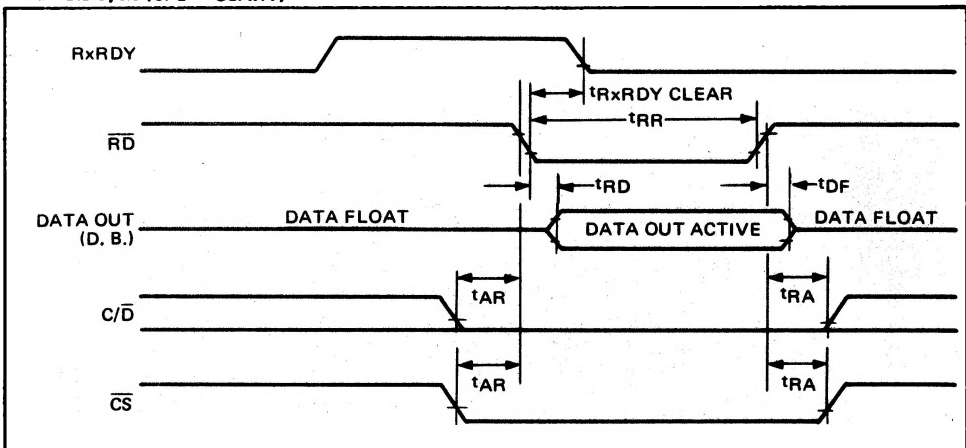

### Receiver Clock and Data

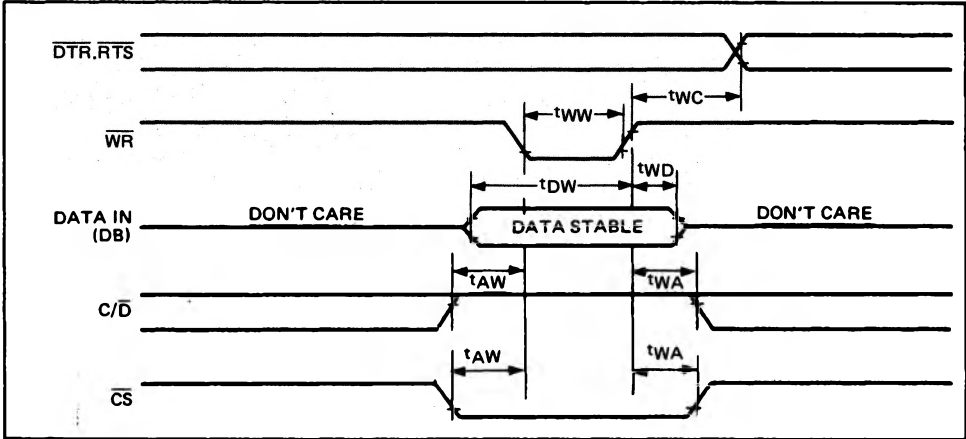

### Write Data Cycle (CPU → USART)

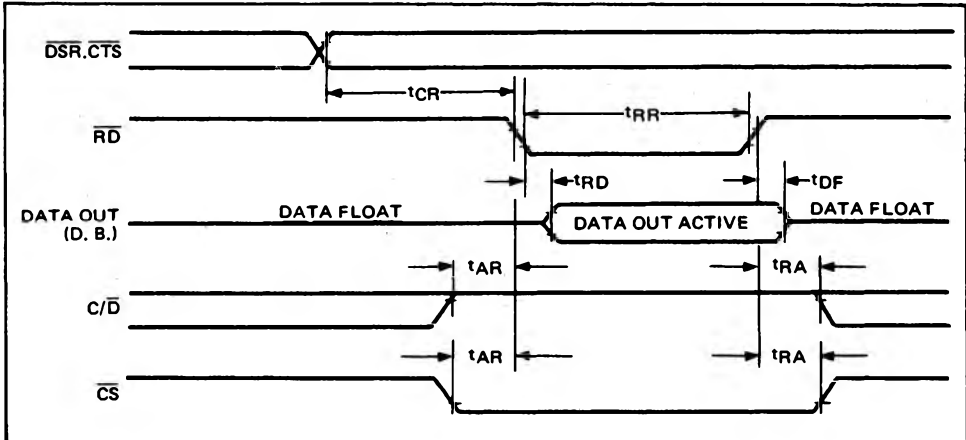

### Read Data Cycle (CPU ← USART)

**Write Control or Output Port Cycle (CPU → USART)**

**Read Control or Input Port (CPU ← USART)**

**Transmitter Control and Flag Timing (ASYNC Mode)**

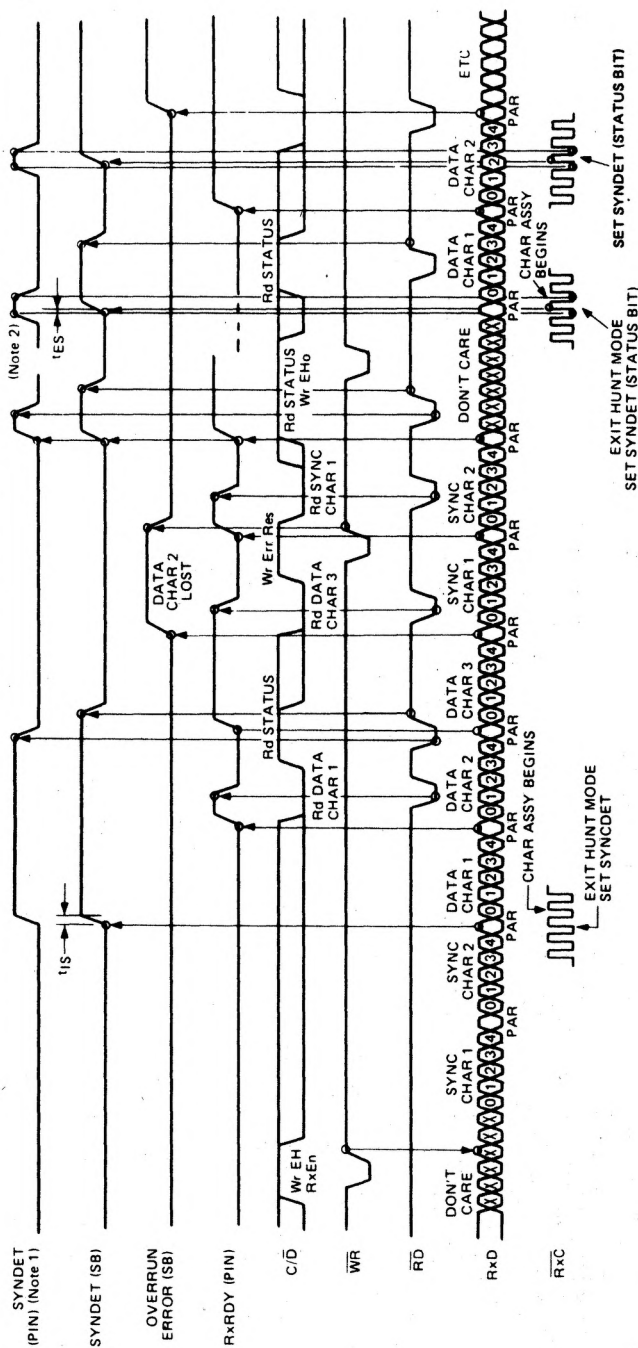

**(Note)** The wave-form chart is based on the case of 7 data bit length + parity bit + 2 stop bit.

# Transmitter Control and Flag Timing (SYNC Mode)

(Note) The wave-form chart is based on the case of 5 data bit length + parity bit and 2 synchronous characters.

# Receiver Control and Flag Timing (SYNC Mode)

(Note 1) Internal synchronization is based on the case of 5 data bit length + parity bit and 2 synchronous characters.

(Note 2) External synchronization is based on the case of 5 data bit length + parity bit.
