

SCAN18374T D Flip-Flop with TRI-STATE® Outputs

General Description

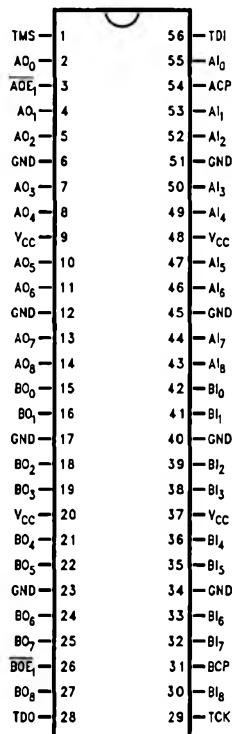

The SCAN18374T is a high speed, low-power D-type flip-flop featuring separate D-type inputs organized into dual 9-bit bytes with byte-oriented clock and output enable control signals. This device is compliant with IEEE 1149.1 Standard Test Access Port and BOUNDARY-SCAN Architecture with the incorporation of the defined BOUNDARY-SCAN test logic and test access port consisting of Test Data Input (TDI), Test Data Out (TDO), Test Mode Select (TMS), and Test Clock (TCK).

Features

- IEEE 1149.1 (JTAG) Compliant
- Buffered positive edge-triggered clock
- TRI-STATE outputs for bus-oriented applications
- 9-bit data busses for parity applications
- Reduced-swing outputs source 32 mA/sink 64 mA (Comm), source 24 mA/sink 48 mA (Mil)
- Guaranteed to drive 50Ω transmission line to TTL input levels of 0.8V and 2.0V
- TTL compatible inputs
- 25 mil pitch SSOP (Shrink Small Outline Package)
- Includes CLAMP and HIGHZ instructions
- Member of National's SCAN Products

Ordering Code: See Section 11

X = Immaterial

Z = High Impedance

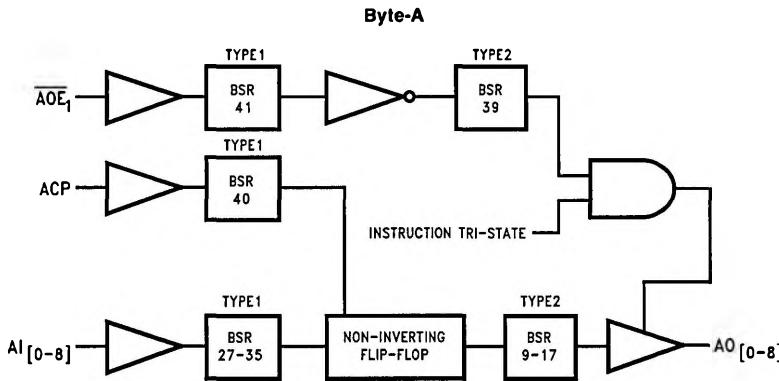

/\ = L-to-H Transition

Functional Description

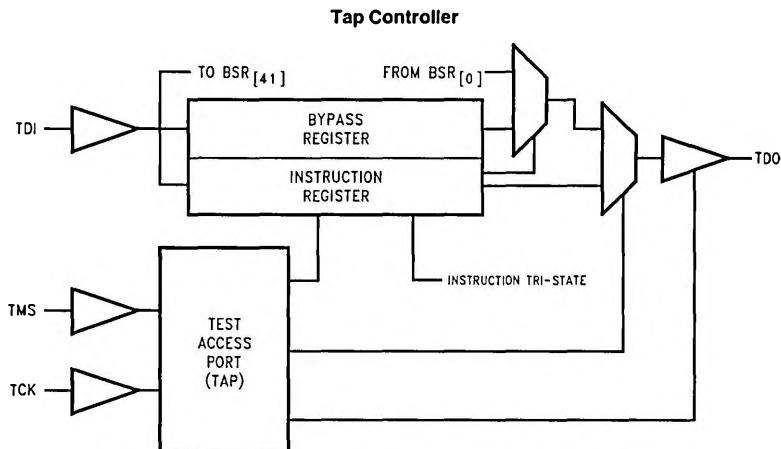

The SCAN18374 consists of two sets of nine edge-triggered flip-flops with individual D-type inputs and TRI-STATE true outputs. The buffered clock and buffered Output Enable pins are common to all flip-flops. Each set of the nine flip-flops will store the state of their individual D inputs that meet the setup and hold time requirements on the LOW-to-HIGH Clock (ACP or BCP) transition. With the Output Enable (\overline{AOE}_1 or \overline{BOE}_1) LOW, the contents of the nine flip-flops are available at the outputs. When the Output Enable is HIGH, the outputs go to the high impedance state. Operation of the Output Enable input does not affect the state of the flip-flops.

Logic Diagram

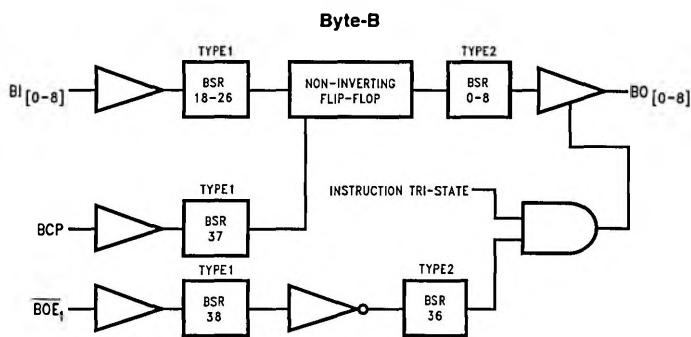

Please note that this diagram is provided only for the understanding of logic operations and should not be used to estimate propagation delays.

Block Diagrams

Note: BSR stands for Boundary Scan Register

Block Diagrams (Continued)

TL/F/10963-3

TL/F/10963-4

Note: BSR stands for Boundary Scan Register

Description of Boundary-Scan Circuitry

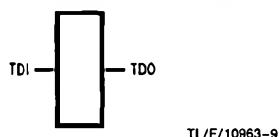

The scan cells used in the BOUNDARY-SCAN register are one of the following two types depending upon their location. Scan cell TYPE1 is intended to solely observe system data, while TYPE2 has the additional ability to control system data. (See IEEE Standard 1149.1 *Figure 10-11* for a further description of scan cell TYPE1 and *Figure 10-12* for a further description of scan cell TYPE2.)

Scan cell TYPE1 is located on each system input pin while scan cell TYPE2 is located at each system output pin as well as at each of the two internal active-high output enable signals. AOE controls the activity of the A-outputs while BOE controls the activity of the B-outputs. Each will activate their respective outputs by loading a logic high.

The BYPASS register is a single bit shift register stage identical to scan cell TYPE1. It captures a fixed logic low.

Bypass Register Scan Chain Definition

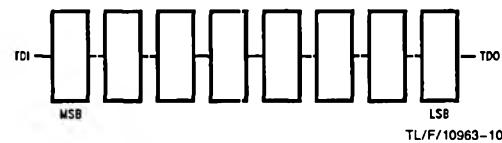

Logic 0

The INSTRUCTION register is an eight-bit register which captures the value 00111101.

The two least significant bits of this captured value (01) are required by IEEE Std 1149.1. The upper six bits are unique to the SCAN18374T device. SCAN CMOS Test Access Logic devices do not include the IEEE 1149.1 optional identification register. Therefore, this unique captured value can be used as a "pseudo ID" code to confirm that the correct device is placed in the appropriate location in the boundary scan chain.

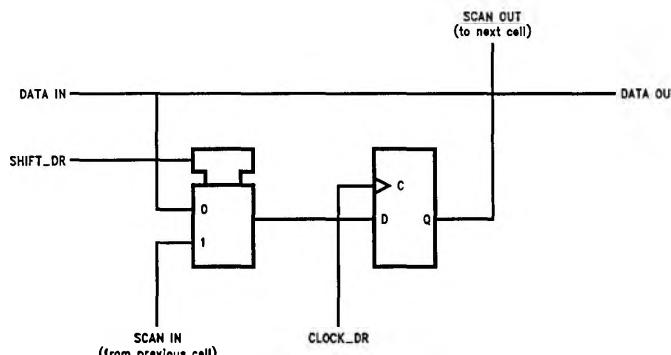

Instruction Register Scan Chain Definition

Absolute Maximum Ratings (Note 1)

If Military/Aerospace specified devices are required, please contact the National Semiconductor Sales Office/Distributors for availability and specifications.

Supply Voltage (V_{CC})	–0.5V to +7.0V	
DC Input Diode Current (I_{IK})	$V_I = -0.5V$	–20 mA
	$V_I = V_{CC} + 0.5V$	+20 mA
DC Output Diode Current (I_{OK})	$V_O = -0.5V$	–20 mA
	$V_O = V_{CC} + 0.5V$	+20 mA
DC Output Voltage (V_O)	–0.5V to V_{CC}	+0.5V
DC Output Source/Sink Current (I_O)	± 70 mA	
DC V_{CC} or Ground Current Per Output Pin	± 70 mA	
Junction Temperature SSOP	$+140^\circ C$	
Storage Temperature	–65°C to +150°C	2000V
ESD (Min)		

Note 1: Absolute maximum ratings are those values beyond which damage to the device may occur. The databook specifications should be met, without exception, to ensure that the system design is reliable over its power supply, temperature, and output/input loading variables. National does not recommend operation of SCAN™ circuits outside databook specifications.

Recommended Operating Conditions

Supply Voltage (V_{CC})	SCAN Products	4.5V to 5.5V
Input Voltage (V_I)	0V to V_{CC}	
Output Voltage (V_O)	0V to V_{CC}	
Operating Temperature (T_A)	Commercial	–40°C to +85°C
	Military	–55°C to +125°C
Minimum Input Edge Rate dV/dt	125 mV/ns	
V_{IN} from 0.8V to 2.0V		
V_{CC} @ 4.5V, 5.5V

*Voltage Range 5.0 is 5.0V ± 0.5V.

All Input Timing Delays involving TCK are measured from the rising edge of TCK.

Note 1: This delay represents the timing relationship between the data input and TCK at the associated scan cells numbered 0-8, 9-17, 18-26 and 27-35.

Note 2: This delay represents the timing relationship between AOE, BOE and TCK at scan cells 36 and 39 only.

Note 3: Timing pertains to BSR 38 and 41 only.

Note 4: Timing pertains to BSR 37 and 40 only.

tPHZ, tpLZ	Output Disable Time	2.0 2.0	10.5 10.5		2.0 2.0	11.0 11.0			(Note 5)		(Note 5)		ns	
tOSHL (Note 1)	Pin to Pin Skew HL Data to Output		0.5 0.5	1.0 1.0					1.0				ns	
tOSLH (Note 1)	Pin to Pin Skew LH Data to Output		0.5 0.5	1.0 1.0					1.0				ns	

Note 1: Skew is defined as the absolute value of the difference between the actual propagation delays for any two separate outputs of the same device. The specification applies to any outputs switching HIGH to LOW (tOSHL), LOW to HIGH (tOSLH), or any combination switching LOW to HIGH and/or HIGH to LOW.

Note 2: This specification is guaranteed but not tested. The limits apply to propagation delays for all paths described switching in phase (i.e., all low-to-high, high-to-low, etc.).

Note 3: This specification is guaranteed but not tested. The limits represent propagation delays with 250 pF load capacitors in place of the 50 pF load capacitors in the standard AC load. This specification pertains to single output switching only.

Note 4: TRI-STATE delays are load dominated and have been excluded from the datasheet.

Note 5: The Output Disable Time is dominated by the RC network (500Ω, 250 pF) on the output and has been excluded from the datasheet.

Capacitance

Symbol	Parameter	Typ	Units	Conditions
CIN	Input Pin Capacitance	4.0	pF	VCC = 5.0V
COUT	Output Pin Capacitance	13.0	pF	VCC = 5.0V
CPD	Power Dissipation Capacitance	34.0	pF	VCC = 5.0V
