

TA8899AF

FM DEMODULATION IC FOR BROADCASTING SATELLITE RECEIVER

TA8899AF combines the necessary function on a single monolithic integrated circuit to demodulate FM signal of the 2nd IF of DBS.

FEATURES

- 5V single power source
- 2nd IF AGC amplifier (AGC range 50dB or more)
- Logarithmic-linear type signal level amplifier
- PLL type FM detector (variable impedance built in)
- Adjustment free AFT circuit (IF frequency direct count type digital AFT) and also designed for keyed AFT system
- Output terminal of 1'st AGC control circuit

Weight : 0.63g (Typ.)

000707EBA1

- TOSHIBA is continually working to improve the quality and reliability of its products. Nevertheless, semiconductor devices in general can malfunction or fail due to their inherent electrical sensitivity and vulnerability to physical stress. It is the responsibility of the buyer, when utilizing TOSHIBA products, to comply with the standards of safety in making a safe design for the entire system, and to avoid situations in which a malfunction or failure of such TOSHIBA products could cause loss of human life, bodily injury or damage to property. In developing your designs, please ensure that TOSHIBA products are used within specified operating ranges as set forth in the "Handling Guide for Semiconductor Devices," or "TOSHIBA Semiconductor Reliability Handbook" etc..
- The TOSHIBA products listed in this document are intended for usage in general electronics applications (computer, personal equipment, office equipment, measuring equipment, industrial robotics, domestic appliances, etc.). These TOSHIBA products are neither intended nor warranted for usage in equipment that requires extraordinarily high quality and/or reliability or a malfunction or failure of which may cause loss of human life or bodily injury ("Unintended Usage"). Unintended Usage include atomic energy control instruments, airplane or spaceship instruments, transportation instruments, traffic signal instruments, combustion control instruments, medical instruments, all types of safety devices, etc.. Unintended Usage of TOSHIBA products listed in this document shall be made at the customer's own risk.
- The products described in this document are subject to the foreign exchange and foreign trade laws.
- The information contained herein is presented only as a guide for the applications of our products. No responsibility is assumed by TOSHIBA CORPORATION for any infringements of intellectual property or other rights of the third parties which may result from its use. No license is granted by implication or otherwise under any intellectual property or other rights of TOSHIBA CORPORATION or others.
- The information contained herein is subject to change without notice.

The diagram illustrates the internal architecture of the IC101 receiver chip, showing the flow of signals and power between various functional blocks and the external pins (1-30).

Functional Blocks and Connections:

- OSC (Oscillator):** Connected to pins 29 and 30 (X'tal Oscillation).
- Control Logic:** Receives a **Keyed Pulse Input** at pin 1 and provides control signals to the **Digital Filter**, **Counter**, **IF Amp.**, and **AGC Loop Amp.**
- Digital Filter:** Receives signals from the **Counter** and the **IF Amp.** to produce the **AFT Output (Digital)** at pin 25.
- Counter:** Provides a clock signal to the **Digital Filter** and the **VCO**.
- IF Amp. (Intermediate Frequency Amplifier):** Receives the **2nd IF Input** at pin 22 and provides gain to the **Digital Filter** and the **AGC Loop Amp.**
- AGC Loop Amp. (Automatic Gain Control Loop Amplifier):** Receives feedback signals from the **AGC Det.** and the **IF Amp.** to control the gain of the **IF Amp.**
- AGC Det. (Automatic Gain Control Detector):** Detects the signal level and provides feedback to the **AGC Loop Amp.** and the **1st AGC Slice Adjustment** at pin 16.
- AGC Slice Adjustment:** A potentiometer connected to pins 16, 17, and 18, providing a **1st AGC output** at pin 18.
- 1st AGC Filter:** A low-pass filter connected to pins 17 and 18.
- Signal Level Voltage Output:** Provides a measure of the signal level at pin 19.
- 2nd AGC Adjustment:** A potentiometer connected to pins 13, 14, and 15, providing a **2nd AGC** at pin 15.
- 2nd AGC Filter:** A low-pass filter connected to pins 14 and 15.
- VCO (Voltage Controlled Oscillator):** Receives a **VCO tank** signal at pin 10 and provides a **VCO** output at pin 8.
- Mixer:** Receives the **VCO** output at pin 8 and the **IF Amp.** output to produce the **AFT output (Analog)** at pin 23.
- Clip (Clipping):** Receives the **AFT output (Analog)** at pin 23 and provides a **Clip** signal to the **Digital Filter** and the **IF Amp.**
- DAC (Digital-to-Analog Converter):** Provides a **DAC** output to the **Clip** block.
- Video Amp. (Video Amplifier):** Receives the **AFT output (Analog)** at pin 23 and provides a **Video Amp.** output at pin 4.
- Video Amplifier Level Adjustment:** A potentiometer connected to pins 4, 5, and 6, providing a **Video Amplifier Level Adjustment** at pin 5.
- Loop Filter:** A low-pass filter connected to pins 6 and 7.
- DC Feedback Filter:** A low-pass filter connected to pins 27 and 28.
- Bias Monitor:** A potentiometer connected to pins 27, 28, and 29, providing a **Bias Monitor** output at pin 28.
- VCC (Logic):** A 5V supply connected to pin 26.
- VCC (Analog):** A 5V supply connected to pin 11.
- GND1:** Ground connection at pin 8.
- GND2:** Ground connection at pin 21.

TERMINAL FUNCTION

PIN No.	PIN NAME	FUNCTION	INTERFACE CIRCUIT
1	Keyed Pulse Input	It clamps at the pulse peak and generates the reference level. The input impedance is $3k\Omega$.	
2 3	Detect Output	It outputs the detection output through a low-pass filter of 30MHz cut off frequency using an emitter follower.	
4 5	Video Amplifier Level Adjustment	It controls the level adjustment by varying the emitter resistor of a differential amplifier. If the resistor between pins 4 and 5 is reduced the output will be greater, however, since the output dynamic range is narrow the output level should be used in the range of lower than $0.7V_{p-p}$.	
6 7	Loop Filter	The output impedance is 200Ω .	

PIN No.	PIN NAME	FUNCTION	INTERFACE CIRCUIT
8	GND1	It is the GND of VCO circuit blocks that are VCO (pins 9, 10, 12), loop filter (pins 6, 7), video amplifier (pins 4, 5) AFT system (pins 1, 23, 24, 25, 26, 27, 28) and S/H (pins 29, 30).	—
9 10	VCO tank	It is the VCO using variations in internal impedance of diode for control voltage from mixer. Use a UJ characteristic for the capacitor of the external tank circuit to correct the internal temperature drift.	
12	VCO Temperature Compensate Bias	The VCO bias is composed of a synthesis of bias in proportion to V_{BE} and V_T of transistor, and this terminal generates a bias proportioned to the V_{BE} . If the external resistor is reduced, the VCO sensitivity will rise.	
13	2nd AGC Adjustment	It changes the input level into AGC detector. It adjusts by adding the direct current off-set to pins 14 and 15. The variation width of about 8dB can be added. Internal bias is 2.5V.	

PIN No.	PIN NAME	FUNCTION	INTERFACE CIRCUIT
14 15	2nd AGC Filter	It generates the AGC voltage by filtering the 403MHz IF signal by means of an internal resistor and an external capacitor. If applying the V _{CC} to pin 15 and with supplying 2.5V bias to pin 27, the AGC will be minimum gain and the VCO oscillates at free-running frequency.	
16	1st AGC Slice Adjustment	It sets the input level threshold for generating the control signal to lower gain from the IC to the 2nd converter of front stage when excessive signal input. Even if the 2nd AGC adjustment varies, the 1st AGC adjustment point hardly changes. The internal bias is 2.5V.	
17	1st AGC Filter	It outputs by comparing with the AGC and 1st AGC slice level adjustment voltages. This comparator is constructed by the active load type high gain amplifier and determined its response by a capacitor connected to this terminal.	
18	1st AGC Control	It outputs the control voltage using an emitter follower (active low level). The internal current sink has only 25μA.	

PIN No.	PIN NAME	FUNCTION	INTERFACE CIRCUIT
19	Signal Level Voltage Output	It outputs the AGC voltage by doing logarithm --> linear conversion. In the TA8899AF the level detection can be carried out even after the 1st AGC is effective and input is reduced using the 1st AGC output.	
20 22	2nd IF Input	The IF amplifier constructed by the 3-step series connection of variable gm type amplifiers, of which the maximum gain is 47dB and minimum gain – 8dB. In order to prevent a sneak of radio frequency, all the circuits are balance-connected. Therefore, the differential combination is also desirable for the IC input. The internal bias is 2.0V and input impedance is 1kΩ.	
23	AFT Output (Analog)	This counts the IF frequency, averages the count data, carries out D/A conversion of the signal and outputs an AFT signal. X'tal is used for the reference signal of this AFT operation, so operation is stabilized against temperature. Furthermore, an AFT signal is created from an IF signal, and so VCO oscillation is an independent operation.	

PIN No.	PIN NAME	FUNCTION	INTERFACE CIRCUIT
24 25	AFT Output (Digital)	These are high detection ("H" when the IF signal is high) and low detection ("H" when the IF signal is low). These shows both outputs is high when the input frequency is nearby 402.78MHz.	
26	VCC (Logic Block)	To avoid interference of digital circuits and analog circuits connect to the power line through a $1\mu\text{H}$ inductor.	—
27	DC Feedback Filter	In order to correct the lag between the VCO's f_o and the input's IF signal, the wave detection output's DC offset is used and a circuit installed which feeds this back to the VCO oscillation frequency. The low pass filter for detecting this DC offset is composed of an internal resistor and an external capacitor. ($f_c \approx 1\text{Hz}$)	
28	Bias Monitor	This terminal monitors the bias of an internal logic circuit. Normally keep it open.	
29 30	X'tal Oscillation	This is the 4MHz X'tal oscillation terminal, the reference for internal digital operations. When supplying 4MHz OSC from other, please input to a 29 pin.	

MAXIMUM RATINGS (Ta = 25°C)

CHARACTERISTIC	SYMBOL	RATING	UNIT
Power Supply Voltage	V _{CC} MAX	6.0	V

MEASUREMENT CONDITION

(Note 1) 1st AGC Shoulder Level Range : AGC_{MAX}

$F = 402.78\text{MHz}$ input level $v_{in} = 0$ to -40dBmW (50Ω) to pin 20. Measure v_{in} that pin 18 voltage is lower than 4V by opening pin 16 and raising v_{in} .

(Note 2) 1st AGC Control Sensitivity : ΔAGC

Input $f = 402.78\text{MHz}$ $v_{in} = 0 \sim -40\text{dBmW}$ (50Ω) to pin 20. Calculate v_{in} that pin 18 voltage is 4V / 1V (as v_{in1} , v_{in2}), using the equation below.

$$\Delta AGC = -3 / (v_{in1} - v_{in2}) \quad \text{V / dB}$$

(Note 3) Signal Level Sensitivity : $\Delta V / \Delta v$

Measure each output voltage of pin 19 at $v_{in} = -40, -60\text{dBmW}$ (50Ω)

$$\Delta V / \Delta V = (V_{-60} - V_{-40}) / 20 \quad \text{mV / dB}$$

(Note 4) VCO Conversion Sensitivity : β

Input $f = 402.78\text{MHz}$ and sweep $\pm 5\text{MHz}$, $v_{in} = -30\text{dBmW}$ (50Ω) to pin 20.

Calculate $\beta = 10 / (V_{det+5} - V_{det-5})$ and multiply the gain portion (2.66) of video amplifier when outputting a direct current voltage to pin 3 at 407.78MHz, 397.78MHz as V_{det+5} and V_{det-5} each.

(Note 5) VCO Temperature Drift : Δf_{Ta}

Short pin 6 and 7, and connect pin 14 to GND.

Measure the VCO frequency at ambient temperature $T_a = 25^\circ\text{C}$, -10°C + 65°C and calculate how much frequency changes from at 25°C . (read out the VCO leakage output by spectrum analyzer.)

(Note 6) PLL Lock Range : f_L , Capture Range : f_{ca}

Measure the range that synchronizes with VCO by putting pin 20 input frequency away from the free-running frequency.

(Note 7) Demodulation Output Level : V_{out}

Input pin 20 $f = 402.78\text{MHz}$, $f_m = 100\text{kHz}$, $\Delta f = 10\text{MHz}_{p-p}$, $v_{in} = -30\text{dBmW}$ (50Ω)

Open pin 4 and 5 and measure the output level of pin 3.

(Note 8) Video Amplifier Variable Width : V_{outS} , V_{out5}

Input pin 20 $f = 402.78\text{MHz}$, $f_m = 100\text{kHz}$, $\Delta f = 10\text{MHz}_{p-p}$, $v_{in} = -30\text{dBmW}$ (50Ω)

Measure the variation of video output by shorting between pin 4 and 5 and connecting a $5k\Omega$ resistance.

(Note 9) Demodulation Output level Width, Group Delay Characteristics : V_{outA} , τ_{pd}

Input pin 20 $f = 402.78\text{MHz}$, $f_m = 100\text{kHz}$, 60Hz to 4MHz to 9MHz, $\Delta f = 5\text{MHz}_{p-p}$, $v_{in} = -30\text{dBmW}$ (50Ω)

Compare to the value at 100kHz by opening pin 4 and 5, and measuring the output level and group delay of pin 3.

(Note 10) Keyed Pulse Allowable Period : T_1

Input pin 20 $f = 402.78\text{MHz}$, $f_m = 100\text{kHz}$, $\Delta f = 10\text{MHz}_{\text{p-p}}$, $v_{\text{in}} = -30\text{dBmW}$ (50Ω)
Input the signal below to pin 1 and open pin 27 and 28.

Observe the pin 23 output and change f so as to be 2.5V voltage.

(Note 11) AFT Sensitivity : $\Delta f / \Delta V_{23}$

Input pin 20 $f = 402.78\text{MHz} \pm 1\text{MHz}$, $v_{\text{in}} = -30\text{dBmW}$ (50Ω)

Adjust f so that pin 23 output will be 2.5V. By moving f up. and down, calculate each frequency as f_H , f_L when pin 23 voltage varies 0.5V using the following equation.

$$\Delta f / \Delta V_{23} = f_H - f_L \text{ (MHz/V)}$$

(Note 12) AFT Digital Output Width of dead zone : f_{DEAD}

Input pin 20 $f = 402.78\text{MHz} \pm 5\text{MHz}$, $v_{\text{in}} = -30\text{dBmW}$ (50Ω)

Measure the input frequency range in which both pin 24 and 25 become high level, by sweeping f .

(Note 13) DG, DP

Input pin 20 $f = 402.78\text{MHz} \pm 5\text{MHz}$, $v_{\text{in}} = -30\text{dBmW}$ (50Ω), $\Delta f = 17\text{MHz}_{\text{p-p}}$, Gray level video signal (APL : 10~90%)...Pre-emphasis-on

(Note 14) IM2, IM3

Input pin 20 $f = 402.78\text{MHz} \pm 5\text{MHz}$, $v_{\text{in}} = -30\text{dBmW}$ (50Ω), $\Delta f = 17\text{MHz}_{\text{p-p}}$, Color subcarrier (3.579MHz), Sound subcarrier (5.7272MHz) ...

Observe the frequency component outputting to the screen output pin (pin 3) through the video gate of a video noise meter by spectrum analyzer, and measure the level difference between 3.579MHz component and 2.15MHz, 1.43MHz components.
