

INTERFACE CIRCUIT (RELAY AND LAMP DRIVER)

- HIGH OUTPUT CURRENT
- ADJUSTABLE SHORT-CIRCUIT PROTECTION TO GROUND
- INTERNAL THERMAL PROTECTION WITH HYSTERESIS TO AVOID THE INTERMEDIATE OUTPUT LEVELS
- LARGE SUPPLY VOLTAGE RANGE : + 10 V TO + 30 V
- SHORT-CIRCUIT PROTECTION TO V_{CC}

DESCRIPTION

The TDE3207 is a monolithic amplifier designed for high-current and high-voltage applications, specifically to drive lamps, relays and stepping motors.

This device is essentially blow-out proof. Current limiting is available to limit the peak output current to a safe value, the adjustment only requires one external resistor. In addition, thermal shut down is provided to keep the IC from overheating. If external dissipation becomes too high, the driver will shut down to prevent excessive heating.

The output is also protected from short-circuits with the positive power supply.

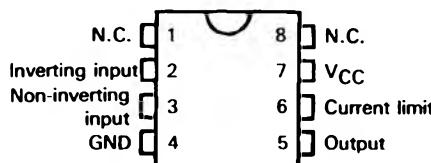

The device operates over a wide range of supply voltages from standard ± 15 V operational amplifier supplies down to the single + 12 V or + 24 V used for industrial electronic systems.

- Notes :**
- For operating at high temperatures, the TDE3207 must be derated based on a $+150^{\circ}\text{C}$ maximum junction temperature and a junction-ambient thermal resistance of 110°C/W .
 - The offset voltage given is the maximum value of input voltage required to drive the output voltage within 2 V of the ground or the supply voltage.
