

PCMCIA UNIVERSAL ASYNCHRONOUS RECEIVER TRANSMITTER

SLLS627– SEPTEMBER 2004

- Integrated Asynchronous Communications Element (ACE) Compatible With PCMCIA PC Card Standard Release 2.01
- Consists of a Single TL16C550 ACE Plus PCMCIA Interface Logic
- Provides Common I-Bus/Z-Bus Microcontroller Inputs for Most Intel™ and Zilog™ Subsystems
- Fully Programmable 256-Byte Card Information Structure (CIS) and 8-Byte Card Configuration Register (CCR)
- Adds or Deletes Standard Asynchronous Communication Bits (Start, Stop and Parity) to or From Serial Data Stream
- Independently Controlled Transmit, Receive, Line Status, and Data Set Interrupts
- Subsystem Selectable Serial-Bypass Mode Provides Subsystem With Direct Parallel Access to the FIFOs
- Fully Programmable Serial-Interface Characteristics:
 - 5-, 6-, 7-, or 8-Bit Characters
 - Even-, Odd-, or No-Parity Bit Generation and Detection
 - 1-, 1 1/2-, or 2-Stop Bit Generation
 - Baud-Rate Generation
- Fully Prioritized Interrupt System Controls
- Modem Control Functions
- Provides TL16C450 Mode at Reset Plus Selectable Normal TL16C550 Operation or Extended 64-Byte FIFO Mode
- Selectable Auto-RTS Mode Deactivates RTS at 14 Bytes in 550 Mode and at 56 Bytes in Extended 550 Mode
- Selectable Auto-CTS Mode Deactivates Serial Transfers When CTS is Inactive
- Available in 100 Pin Thin Quad Flatpack (PZ) Package

description

The TL16PC564BLVI is designed to provide all the functions necessary for a Personal Computer Memory Card International Association (PCMCIA) universal asynchronous receiver transmitter (UART) subsystem interface. This interface provides a serial-to-parallel conversion for data to and from a modem coder-decoder/digital signal processor (CODEC/DSP) function to a PCMCIA parallel data-port format. A computer central processing unit (CPU), through a PCMCIA host controller, can read the status of the asynchronous communications element (ACE) interface at any point in the operation. Reported status information includes the type of transfer operation in process, the status of the operation, and any error conditions encountered.

Attribute memory consists of a 256-byte card information structure (CIS) and eight 8-byte card configuration registers (CCR). The CIS, implemented with a dual-port random-access memory (DPRAM), is available to both the host CPU and subsystem (modem), as are the CCRs. This DPRAM is used in place of the electrically erasable programmable read-only memory (EEPROM) normally used for the CIS. At power up, attribute memory is initialized by the subsystem.

The TL16PC564BLVI uses a TL16C550 ACE-type core with an expanded 64×11 receiver first-in-first-out (FIFO) memory and a 64×8 transmitter FIFO memory. The receiver trigger logic flags have been adjusted in order to take full advantage of the increased capacity when in the extended mode. In addition, eight of the UART registers have been mapped into the subsystem (modem) memory space as read-only registers. This allows the subsystem to read UART status information.

A subsystem-selectable serial-bypass mode has been implemented to allow the subsystem to bypass the serial portion of the UART and write directly to the receiver FIFO and read directly from the transmitter FIFO. Interrupt operation is not affected in this mode.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

Intel is a registered trademark of Intel System, Inc.
Zilog is a registered trademark of Zilog Incorporated
MicroStar BGA is a trademark of Texas Instruments Incorporated.

PRODUCTION DATA information is current as of publication date. Products conform to specifications per the terms of Texas Instruments standard warranty. Production processing does not necessarily include testing of all parameters.

PCMCIA UNIVERSAL ASYNCHRONOUS RECEIVER TRANSMITTER

SLLS627– SEPTEMBER 2004

Terminal Functions

TERMINAL NAME	PZ NO.	INTER- FACET†	I/O	DESCRIPTION
ALE (\overline{AS})	26	S	I	Address-latch enable/address strobe. ALE(\overline{AS}) is an address-latch enable in the Intel mode and an address strobe in the Zilog mode. ALE (\overline{AS}) is active high for an Intel subsystem and active low for a Zilog subsystem.
ARBCLKO	7	M	O	Arbitration clock output. ARBCLKO is equal to the input on ARBCLKI divided by the binary-coded divisor input on ARBPGM (1–0).
ARBCLKI	5	M	I	Arbitration clock input. ARBCLKI is the base clock used in arbitration for the attribute memory DRAM and the reset validation circuitry.
ARBPGM0 ARBPGM1	8 9	M	I	Arbitration clock divisor program. These two bits set the divisor for ARBCLKI. Divide by 1, 2, 4, and 8 are available.
BAUDOUT	38	U	O	Baud output. BAUDOUT is an active-low 16× signal for the transmitter section of the UART. The clock rate is established by the reference clock (UARTCLK) frequency divided by a divisor specified by the baud generator divisor latches. BAUDOUT may also be used for the receiver section by tying this output to the RCLK input.
CE1 CE2	94 62	H	I	Card enable 1 and card enable 2 are active-low signals. CE1 enables even-numbered address bytes, and CE2 enables odd-numbered address bytes. A multiplexing scheme based on HA0, CE1, and CE2 allows an 8-bit host to access all data on HD0 through HD7 if desired. These signals have internal pullup resistors.
\overline{CS}	32	S	I	Chip select. \overline{CS} is the active-low chip select from the Zilog or Intel microcontroller.
CTS	49	U	I	Clear to send. CTS is an active-low modem status signal whose condition can be checked by reading bit 4 (CTS) of the modem status register (MSR). Bit 0 (delta clear to send) of the MSR indicates that the signal has changed states since the last read from the MSR. If the modem-status interrupt is enabled when CTS changes states, an interrupt is generated.
DCD	48	U	I	Data carrier detect. DCD is an active-low modem-status signal whose condition can be checked by reading bit 7 (DCD) of the MSR. Bit 3 (delta data carrier detect) of the MSR indicates that the signal has changed states since the last read from the MSR. If the modem-status interrupt is enabled when DCD changes states, an interrupt is generated.
DSR	46	U	I	Data set ready. DSR is an active-low modem status signal whose condition can be checked by reading bit 5 (DSR) of the MSR. Bit 1 (delta data set ready) of the MSR indicates that the signal has changed states since the last read from the MSR. If the modem-status interrupt is enabled when DSR changes states, an interrupt is generated.
DTR	34	U	O	Data terminal ready. DSD is an active-low signal. When active, DTR informs the modem or data set that the UART is ready to establish communication. DTR is placed in the active state by setting the DTR bit 0 of the modem control register (MCR) to a high level. DTR is placed in the inactive state either as a result of a reset, doing a loop-mode operation, or resetting bit 0 (DTR) of the MCR.
EXTEND	1	U	I	FIFO extend. When EXTEND is high, the UART is configured as a standard TL16C550 with 16-byte transmit and receive FIFOs. When EXTEND is low and FIFO control register (FCR) bit 5 is high, the FIFOs are extended to 64 bytes and the receiver-interrupt trigger levels adjust accordingly. EXTEND low in conjunction with FIFO control register (FCR) bit 4 set high enables the auto-RTS function.
GND	4, 6, 13, 16, 30, 39, 41, 43, 54, 66, 68, 69, 80, 91	M		Common ground

PCMCIA UNIVERSAL ASYNCHRONOUS RECEIVER TRANSMITTER

SLLS627– SEPTEMBER 2004

Terminal Functions

TERMINAL NAME	PZ NO.	INTER- FACET†	I/O	DESCRIPTION
HA0 HA1 HA2 HA3 HA4 HA5 HA6 HA7 HA8 HA9	78 79 81 82 83 84 85 87 90 92	H	I	The 10-bit address bus addresses the attribute memory (bits 1–8) and addresses the internal UART as either PCMCIA I/O (bits 0–2) or as a standard COM port (bits 0–9).
HD0 HD1 HD2 HD3 HD4 HD5 HD6 HD7	77 76 75 100 99 98 96 95	H	I/O	The 8-bit bidirectional data bus transfers data to and from the attribute memory and the internal UART.
$\overline{\text{INPACK}}$	71	H	O	Input port acknowledge. $\overline{\text{INPACK}}$ is an active-low output signal that is asserted when the card responds to an I/O read cycle at the address on the HA bus.
$\overline{\text{IORD}}$	63	H	I	I/O read strobe. $\overline{\text{IORD}}$ is an active-low input signal activated to read data from the card I/O space. The $\overline{\text{REG}}$ signal and at least one of the card enable inputs ($\overline{\text{CE1}}$, $\overline{\text{CE2}}$) must also be active for the I/O transfer to take place. This signal has an internal pullup resistor.
$\overline{\text{IOWR}}$	64	H	I	I/O write strobe. $\overline{\text{IOWR}}$ is an active-low input signal activated to write data to the card I/O space. The $\overline{\text{REG}}$ signal and at least one of the card enable inputs ($\overline{\text{CE1}}$, $\overline{\text{CE2}}$) must also be active for the I/O transfer to take place. This signal has an internal pullup resistor.
$\overline{\text{IREQ}}$	88	H	O	Interrupt request. $\overline{\text{IREQ}}$ is an active-low output signal asserted by the card to indicate to the host CPU that a card device requires host software service. This signal doubles as READY/BUSY during power-up initialization.
IRQ	27	S	O	Interrupt request. This active-high IRQ to the subsystem indicates a host CPU write to attribute memory has occurred.
NANDOUT	12	M	O	This is a production test output.
$\overline{\text{OE}}$	93	H	I	Output enable. $\overline{\text{OE}}$ is an active-low input signal used to gate memory read data from the card. This signal has an internal pullup resistor.
$\overline{\text{OUT1}}$ $\overline{\text{OUT2}}$	37 44	U	O	Output 1 and output 2 are active-low signals. $\overline{\text{OUT1}}$ and $\overline{\text{OUT2}}$ are user-defined output terminals that are set to their active state by setting respective MCR bits (OUT1 and OUT2) high. $\overline{\text{OUT1}}$ and $\overline{\text{OUT2}}$ are set to their inactive (high) state as a result of a reset, doing loop-mode operation, or by resetting bit 2 (OUT1) or bit 3 (OUT2) of the MCR. This signal has an open-drain outputs.
RCLK	40	U	I	Receiver clock. RCLK is the 16x-baud-rate clock input for the receiver section of the UART.
$\overline{\text{RD}}(\overline{\text{DS}})$	29	S	I	Read enable or data strobe input. $\overline{\text{RD}}(\overline{\text{DS}})$ is the active-low read enable in the Intel mode and the active-low data strobe in the Zilog mode.
$\overline{\text{REG}}$	73	H	I	Attribute memory select. This active-low input signal is generated by the host CPU and accesses attribute memory ($\overline{\text{OE}}$ and $\overline{\text{WE}}$ active) and I/O space ($\overline{\text{IORD}}$ or $\overline{\text{IOWR}}$ active). PCMCIA common memory access is excluded. This signal has an internal pullup resistor and hysteresis on the input buffer.
RESET	67	H	I	Reset. RESET is an active-high input that serves as the master reset for the device. RESET clears the UART, placing the card in an unconfigured state. This signal has an internal pullup resistor.

PCMCIA UNIVERSAL ASYNCHRONOUS RECEIVER TRANSMITTER

SLLS627 – SEPTEMBER 2004

Terminal Functions

TERMINAL NAME	PZ NO.	INTER- FACE†	I/O	DESCRIPTION
$\overline{\text{RI}}$	50	U	I	Ring indicator. $\overline{\text{RI}}$ is an active-low modem status signal whose condition can be checked by reading bit 6 (RI) of the MSR. The trailing-edge ring indicator (TERI) bit 2 of the MSR indicates that RI has transitioned from a low to a high state since the last read from the MSR. If the modem status interrupt is enabled when this transition occurs, an interrupt is generated.
$\overline{\text{RST}}$	11	M	O	This is the qualified active-low reset signal. $\overline{\text{RST}}$ has a fail-safe open-drain output.
$\overline{\text{RTS}}$	35	U	O	Request to send is an active-low signal. When active, $\overline{\text{RTS}}$ informs the modem of the data set that the UART is ready to receive data. $\overline{\text{RTS}}$ is set to its active state by setting the RTS modem control register bit and is set to its inactive (high) state either as a result of a reset, doing loop-mode operation, or by resetting bit 1 (RTS) of the MCR.
SA0 SA1 SA2 SA3 SA4 SA5 SA6 SA7	53 55 56 57 58 59 61 65	S	I	When SSAB is high, this is the subsystem address bus and SAD (7–0) is the subsystem data bus. When SSAB is low, this bus is not used and SAD(7–0) is the subsystem multiplexed address/data bus.
SA8	24	S	I	Address bit 8 is bit 8 of the subsystem address bus.
SAD0 SAD1 SAD2 SAD3 SAD4 SAD5 SAD6 SAD7	25 23 20 19 18 17 15 14	S	I/O	Subsystem address/data 7–0. This is a multiplexed bidirectional address/data bus to the attribute-memory DPRAM and CCRs when SSAB is low. This becomes a bidirectional data bus when SSAB is high.
SELZ/ $\overline{\text{I}}$	28	S	I	Select Zilog or Intel mode. SELZ/ $\overline{\text{I}}$ is used to select between a Zilog-like or Intel-like microcontroller. 1 = Zilog, 0 = Intel.
SIN	33	U	I	Serial data input. SIN moves information from the communication line or modem to the TL16PC564BLVI UART receiver circuits. Data on the serial bus is disabled when operating in the loop mode.
SOUT	45	U	O	Serial out. SOUT is the composite serial data output to a connected communication device. SOUT is set to the marking (logic 1) state as a result of a reset.
SSAB	3	S	I	Separate subsystem address bus. SSAB is used to select between a multiplexed address/data bus subsystem interface (SSAB = 0) and a subsystem interface with separate address and data buses (SSAB = 1). This signal has an internal pulldown resistor.
$\overline{\text{STSCHG}}$	74	H	O	Status change. $\overline{\text{STSCHG}}$ is an optional active-low output signal used to alert the host that a subsystem write to attribute memory has occurred. This signal has an open-drain output.
TESTOUT	70	M	O	This is a production test output.
UARTCLK	51	M	O	UART clock. UARTCLK is a clock output whose frequency is determined by the frequency on XIN and the divisor value on the PGMCLK register.
VCC	10,21,22,36, 47,52,60, 72,86,97	M		3.3-V or 5-V supply voltage

† Host = H, Subsystem = S, UART = U, Miscellaneous = M

PCMCIA UNIVERSAL ASYNCHRONOUS RECEIVER TRANSMITTER

Terminal Functions

TERMINAL NAME	PZ NO.	INTER- FACE†	I/O	DESCRIPTION
\overline{WE}	89	H	I	Write enable. \overline{WE} is an active-low input signal used for strobing attribute-memory write data into the card. This signal has an internal pullup resistor
$\overline{WR(R/\overline{W})}$	31	S	I	Write or read/write enable. $\overline{WR(R/\overline{W})}$ is the active-low write enable in the Intel mode and read/write in the Zilog mode.
XIN	42	M	I	Crystal input. XIN is a clock input divided internally based on the PGMCLK register value, then used as the primary UART clock input.
VTEST	2	M	I	VTEST is an active-high production test input with an internal pulldown resistor. It can be left open or tied to ground.

† Host = H, Subsystem = S, UART = U, Miscellaneous = M

detailed description

reset-validation circuit

A reset-validation circuit has been implemented to qualify the active-high RESET input. At power up, the level on the \overline{RST} output is unknown. Whenever RESET is stable for at least eight ARBCLKIs, \overline{RST} reflects the inverted state of that stable value of RESET. Any changes on RESET must be valid for eight ARBCLKI clocks before the change is reflected on \overline{RST} . This 8-clock filter provides needed hysteresis on the master reset input. \overline{RST} is driven by a low-noise, open-drain, fail-safe output buffer.

host CPU memory map

The host CPU attribute memory space is mapped as follows:

Host CPU Address Bits 9–1 (HA0 = 0)	Attribute Memory Space
0 – 255	CIS
256	CCR0
257	CCR1
258	CCR2
259	CCR3
260	CCR4
261	CCR5
262	CCR6
263	CCR7

The host CPU I/O space is mapped as follows:

	Address Mode (hex)				
Normal Mode	COM1	COM2	COM3	COM4	I/O Space
0 (DLAB = 0)†	3F8	2F8	3E8	2E8	UART receiver buffer register (RBR) – read only
0 (DLAB = 0)†	3F8	2F8	3E8	2E8	UART transmitter holding register (THR) – write only
0 (DLAB = 1)†	3F8	2F8	3E8	2E8	UART divisor latch LSB (DLL)
1 (DLAB = 0)†	3F9	2F9	3E9	2E9	UART interrupt enable register (IER)
1 (DLAB = 1)†	3F9	2F9	3E9	2E9	UART divisor latch MSB (DLM)
		A	3EA	2EA	UART interrupt identification register (IIR) – read only
2	3FA	2FA	3EA	2EA	UART FIFO control register (FCR) – write only
3	3FB	2FB	3EB	2EB	UART line control register (LCR)
4	3FC	2FC	3EC	2EC	UART modem control register (MCR) – bit 5 read only
5	3FD	2FD	3ED	2ED	UART line status register (LSR)
6	3FE	2FE	3EE	2EE	UART modem status register (MSR)
7	3FF	2FF	3EF	2EF	UART scratch register (SCR)

† DLAB is bit 7 of the line control register (LCR).

subsystem memory map

The subsystem attribute memory space is mapped as follows:

Subsystem Address Bits 8–0	Attribute Memory Space
0 – 255	CIS
256	CCR0
257	CCR1
258	CCR2
259	CCR3
260	CCR4
261	CCR5
262	CCR6
263	CCR7

The subsystem control space is mapped as follows:

Subsystem Address Bits 8–0	Control Space
272	Control Register
288	PGMCLK Register (write only)

The subsystem UART space is mapped as follows:

Subsystem Address Bits 8–0	UART Space
304	UART MCR bit 5 (write only)
304	UART DLL (read only)
305	UART IER (read only)
306	UART FCR (read only)
307	UART LCR (read only)
308	UART MCR (read only)
309	UART LSR (read only)
310	UART MSR (read only)
311	UART DLM (read only)
320	UART transmitter FIFO (read only) [†]
320	UART receiver FIFO (write only) [†]

[†] Only when serial bypass mode is enabled

host CPU/attribute-memory interface

The host CPU/attribute-memory interface is comprised of one port of the internal DPRAM, the eight CCRs, and necessary control circuitry. Signals HA0 and $\overline{CE1}$ are gated together internally so that the output of the gate is low when both signals have been asserted by the host CPU. This output is combined with \overline{REG} and the decoded address, HA(9–1), to provide the chip enable for the DPRAM and CCRs. This composite chip enable in combination with \overline{WE} or \overline{OE} allows writes and reads to the DPRAM and CCRs.

subsystem/attribute-memory interface

The subsystem/attribute-memory interface is comprised of the second port of the internal DPRAM, the eight CCRs, and necessary control circuitry. When in multiplexed mode (SSAB = 0), the combination of signals SELZ/ \overline{I} and ALE(\overline{AS}) allows either a positive-pulse Intel or a negative-pulse Zilog address latch-enable strobe to latch the address on SA8 and SAD(7–0). When in the Zilog mode (SELZ/ \overline{I} high), the combination of read/write [$\overline{WR}(R/\overline{W})$], data strobe [$\overline{RD}(\overline{DS})$], and decoded address allows ZBUS access. When in the Intel configuration (SELZ/ \overline{I} low), the combination of read [$\overline{RD}(\overline{DS})$], write [$\overline{WR}(R/\overline{W})$], and decoded address allows IBUS access.

When in nonmultiplexed mode (SSAB = 1), SA(7–0) become the lower-order address bits, SAD(7–0) are strictly the bidirectional data bus, and ALE(\overline{AS}) is nonfunctional. All other interface signals function the same.

PCMCIA UNIVERSAL ASYNCHRONOUS RECEIVER TRANSMITTER

SLLS627– SEPTEMBER 2004

SSAB	SELZ/ \bar{I}	$\overline{RD}(\overline{DS})$	$\overline{WR}(\overline{R}/\overline{W})$	Address	Operation
0	0	0	1	SA8, SAD(7–0)	Intel read
0	0	1	0	SA8, SAD(7–0)	Intel write
0	1	0	1	SA8, SAD(7–0)	Zilog read
0	1	0	0	SA8, SAD(7–0)	Zilog write
1	0	0	1	SA(8–0)	Intel read
1	0	1	0	SA(8–0)	Intel write
1	1	0	1	SA(8–0)	Zilog read
1	1	0	0	SA(8–0)	Zilog write

attribute-memory arbitration

Arbitration for the attribute memory is necessary whenever there is simultaneous access to the same DPRAM or CCR address for the conditions of:

- Host CPU read and subsystem write
- Host CPU write and subsystem read
- Host CPU write and subsystem write

If arbitration were not provided, attribute-memory data would be corrupted and invalid data read due to uncontrolled access to the same DPRAM or CCR address.

The arbitration control circuitry synchronizes the asynchronous accesses of the host CPU and subsystem to the DPRAM and CCR and controls the access based on the pending host CPU and subsystem attribute-memory operation. The synchronizing and control circuitry needs a clock called the arbitration clock. The external clock (ARBCLKI) goes through a programmable divider and can be divided by one, two, four, or eight to generate a clock frequency within an allowed range for the arbitration logic to work correctly. The output of this frequency divider is named ARBCLKO. The programmable divider bits are defined as follows:

ARBPGM1	ARBPGM0	INTERNAL ARITRATION CLOCK
L	L	ARBCLKI/1
L	H	ARBCLKI/2
H	L	ARBCLKI/4
H	H	ARBCLKI/8

The upper period limit of ARBCLKO is N/6, where N (ns) is the shortest of the two attribute-memory accesses, host CPU or subsystem. The lower period limit of ARBCLKO is based on the DPRAM specifications at the supply voltage used:

- 5 V = 14-ns clock cycle (71 MHz)
- 3 V = 26-ns clock cycle (38.5 MHz)

For any arbitration condition, attribute-memory access is controlled to ensure valid data is read for a port that is doing a read operation and valid data is written for a port that is doing a write operation. When both the host CPU and subsystem are performing simultaneous write operations to the same address, the host CPU is allowed to write and the subsystem write is ignored.

host CPU/subsystem handshake

Two signals are provided for handshaking between the host CPU and the subsystem. The active-high IRQ signifies to the subsystem that the host CPU has written data into attribute memory. The subsystem can clear IRQ by writing a 1 to bit 6 of the subsystem control register. The active-low \overline{STSCHG} signifies to the host CPU

that the subsystem has written data to attribute memory provided bit 2 of the subsystem control register ($\overline{\text{STSCHG}}$ enable) is high. The host CPU can clear $\overline{\text{STSCHG}}$ by reading any location in attribute memory. The control of these signals is synchronized to $\overline{\text{ARBCLKO}}$ to ensure there are no false assertions/deassertions.

There is additional arbitration performed for instances of simultaneous assertion/deassertion of $\overline{\text{IRQ}}$ or $\overline{\text{STSCHG}}$. When a subsystem write and host CPU read occurs simultaneously, $\overline{\text{STSCHG}}$ may be briefly deasserted prior to being asserted, but the write ultimately wins arbitration. When the host CPU read occurs more than one-half an arbitration clock after the subsystem write, $\overline{\text{STSCHG}}$ is deasserted. $\overline{\text{IRQ}}$ is arbitrated in a similar fashion.

host CPU/UART interface

The UART select is derived from either host CPU address information or logic levels on $\overline{\text{CE1}}$, $\overline{\text{CE2}}$ and $\overline{\text{REG}}$. In the address mode, host CPU address bits HA9, HA7, HA6, HA5, and HA3 are combined with conditional derivatives of HA4 and HA8 to select the UART (HA4 and HA8 select COM ports 1–4 based on settings in the subsystem control register). $\overline{\text{CE1}}$ and $\overline{\text{CE2}}$ are combined such that either of these two signals in combination with $\overline{\text{REG}}$ enable the UART in the event that these signals are present. In the event that $\overline{\text{CE1}}$ or $\overline{\text{CE2}}$ are not present, the UART must be accessed in the address mode previously described. The UART select in conjunction with $\overline{\text{IORD}}$ and $\overline{\text{IOWR}}$ allows host CPU accesses to the UART. Host CPU address bits HA2–HA0 are decoded to select which UART register is to be accessed.

All UART registers remain intact with the exception of the FIFO control register (FCR) and the modem-control register (MCR). The FCR (host CPU write-only address 2) bits 4 and 5 in conjunction with $\overline{\text{EXTEND}}$ control $\overline{\text{RTS}}$ operation and FIFO depth as follows:

BIT 5	BIT 4	$\overline{\text{EXTEND}}$	RTS OPERATION	FIFO DEPTH
X	X	H	Normal	16 bytes
0	0	L	Normal	16 bytes
0	1	L	Auto	16 bytes
1	0	L	Normal	64 bytes
1	1	L	Auto	64 bytes

FCR bit 5 high and $\overline{\text{EXTEND}}$ low redefine the receiver FIFO trigger levels set by FCR bits 6 and 7 as follows:

BIT 7	BIT 6	TRIGGER LEVEL
0	0	1
0	1	16
1	0	32
1	1	56

The MCR (host CPU address 4) bit 5 is read only. Bit 5 is controlled by the subsystem to enable (high) the auto- $\overline{\text{CTS}}$ mode of operation

subsystem/UART interface

The UART provides a serial-communications channel to the subsystem with enhanced $\overline{\text{RTS}}$ control (see auto- $\overline{\text{RTS}}$ description). This channel is capable of operating at 115 kbps and is the main communications channel to the subsystem (refer to the TL16C550 specification for the detailed description of the serial-communications channel).

Many of the UART registers have been mapped into the subsystems memory space as read only. In addition, MCR bit 5 (subsystem address 130 hex) is controlled by the subsystem to enable (high) auto- $\overline{\text{CTS}}$. The subsystem can read the MCR at address 134 hex. When reading the FCR (subsystem address 132 hex), bits 1 and 2 are always high, and bits 4 and 5 are low only when $\overline{\text{EXTEND}}$ is low and the host CPU has set them high (64-byte FIFOs and auto- $\overline{\text{RTS}}$ enabled) (refer to the subsystem memory map).

subsystem control register

The subsystem control register is an 8-bit register located at subsystem address 110 (hex). This register is programmed based on host CPU configuration information and has a default selection of COM2 after a valid reset. The bit definitions are as follows (0 = LSB):

Bits 0 and 1 define which host COM port the UART is connected to when the chip is in the address mode. COM2 is the default (power-up) condition.

BIT 1	BIT 0	COM PORT
0	0	COM1
1	0	COM2
0	1	COM3
1	1	COM4

Bit 2 is a host CPU interrupt-enable bit. When bit 2 is set, any subsystem attribute-memory write cycle causes $\overline{\text{STSCHG}}$ to be asserted. Bit 2 is cleared after a valid reset.

Bit 3 enables or disables address-mode selection as described in the host CPU/UART interface description. Bit 3 is cleared (disabling the address mode) after a valid reset.

Bits 4 and 5 together ensure adherence to PCMCIA power-up requirements. At power up, the card must operate as a memory card and all host CPU I/O operations must be disabled. $\overline{\text{IREQ}}$, which doubles as the host CPU $\text{READY}/\overline{\text{BUSY}}$ line, powers up low, indicating that the memory card is busy. Once the subsystem initializes attribute memory, the subsystem sets bit 4 to indicate that the memory card is ready. Then bit 5 is reset, changing the configuration from a memory card to an I/O card, enabling host CPU UART accesses. $\overline{\text{IREQ}}$ now becomes the host CPU interrupt-request line.

BIT 5	BIT 4	CONFIGURATION
1	0	Memory card, I/O operation (UART) disabled; $\overline{\text{IREQ}}$ is low, indicating card is busy (power-up and reset condition)
1	1	Memory card, I/O operation (UART) disabled; $\overline{\text{IREQ}}$ is high, indicating card is ready
0	X	I/O card, I/O operation (UART) enabled; $\overline{\text{IREQ}}$ now functions as the host CPU interrupt-request line

Bit 6 is a self-clearing bit that resets the subsystem IRQ signal. Writing a 1 to this location clears the IRQ interrupt.

Bit 7 enables or disables serial-bypass mode as described in the subsystem serial-bypass-mode description. Bit 7 is cleared (disabling serial-bypass mode) after a valid reset.

subsystem PGMCLK register/divide-by-n circuit

The subsystem PGMCLK register is a 6-bit write-only register located at address 120 hex and is used to select the divisor of the divide-by-n-and-a-half circuitry. Any write to this register generates a reset to the UART and the divide-by-n circuitry.

The divide-by-n circuitry allows for a divisor from 0 to 31.5 in 0.5 increments (PGMCLK0 is the half bit). The divided clock output drives the UART clock input and can be seen on UARTCLK. The UART requires a clock with a minimum high pulse duration of 50 ns and a minimum low pulse duration of 50 ns (10-MHz maximum operating frequency). A programmed divisor between 2 and 7.5 drives the UART clock low for one XIN clock cycle for integer divisors and one-and-a-half XIN clock cycles for integer-plus-a-half divisors. A programmed divisor of eight or greater drives the UART clock low for four XIN clock cycles for integer divisors. A

four-and-a-half XIN clock cycles for integer-plus-a-half divisors. Based on the above parameters, the acceptable XIN/divisor combinations can be derived. The precision of the programmable clock generator for integer-plus-a-half divisors depends on the closeness to a 50% duty cycle for the XIN input clock.

NOTE

With a divisor less than or equal to 8 (whole number), the UART clock will have a low pulse equal to one clock cycle of the XIN clock. Caution should be used as noted in the following example.

A 20 MHz clock period yields 50 ns total, including rise time and fall time, if a divisor of less than or equal to 8 (whole number) is used. This provides a total down period less than 50 ns to the UART clock, which is less than that which is required for the UART to function properly.

Caution should be used when selecting the XIN and divisor combination.

PGMCLK(0–5) VALUE (HEX)	RESULT
0 (0)	No clock (driven high)
0.5 (1)	Divide-by-1
1 (2)	Divide-by-1
1.5 (3)	Divide-by-1
2 (4) to 31.5 (3F)	Divide-by-2 to divide-by-31.5

subsystem serial-bypass mode

The optional serial-bypass mode is implemented to allow a high-throughput path to/from the host CPU. When this mode is enabled and subsystem control register bit 7 is high, the serial portion of the UART is bypassed and the subsystem has direct parallel access to the receiver FIFO (write address 140 hex) and the transmitter FIFO (read address 140 hex). All host CPU interrupts operate normally except for receiver parity, framing, and breaking interrupts.

auto- $\overline{\text{CTS}}$ operation

The optional auto- $\overline{\text{CTS}}$ operation is implemented so that the host CPU cannot overflow the modem receive buffer. Auto- $\overline{\text{CTS}}$ operation is enabled when the subsystem sets MCR (subsystem address 130 hex) bit 5 high. When enabled, deactivating $\overline{\text{CTS}}$ (high) halts the transmitter section of the UART after it completes the current transfer. Once $\overline{\text{CTS}}$ is reactivated (low) by the modem, transfers resume. Interrupt operation is not affected by enabling auto- $\overline{\text{CTS}}$.

auto- $\overline{\text{RTS}}$ operation

The optional auto- $\overline{\text{RTS}}$ operation is implemented so that the subsystem cannot overflow the receiver FIFO. Auto- $\overline{\text{RTS}}$ operation is enabled when FCR bit 4 is high and $\overline{\text{EXTEND}}$ is low and operates independently from the trigger-level circuitry. In the 16-byte FIFO mode, the RTS bit in the modem-control register (bit 1) clears when 14 characters are in the receive FIFO. This action causes $\overline{\text{RTS}}$ to go high (inactive). In the 64-byte FIFO mode, the MCR RTS bit clears when 56 characters are in the receiver FIFO. Interrupt operation is not affected and operates the same way in either auto- $\overline{\text{RTS}}$ or nonauto- $\overline{\text{RTS}}$ mode. When enabled, a receive-data-available interrupt occurs after the trigger level is reached. The MCR RTS bit must then be set by the host CPU after the receiver FIFO has been read.

power consumption

The TL16PC564BLVI has low power consumption under the following conditions:

- 32-MHz signal on XIN
- Divide-by-n is set to give a 1.8432-MHz UARTCLK signal
- Nominal data
- $V_{CC} = 5\text{ V}$

The current (I_{CC}) and power consumption are 18 mA (typical) and 90 mW (typical), respectively. These current and power figures fluctuate with changes in the above conditions.

absolute maximum ratings over operating free-air temperature range†

Supply voltage range, V_{CC}	–0.5 V to 6 V
Input voltage range, V_I (standard)	–0.5 V to $V_{CC} + 0.5\text{ V}$
Input voltage range, V_I (fail safe)	–0.5 V to 6.5 V
Output voltage range, V_O (standard)	–0.5 V to $V_{CC} + 0.5\text{ V}$
Output voltage range, V_O (fail safe)	–0.5 V to 6.5 V
Input clamp current, I_{IK} ($V_I < 0$ or $V_I > V_{CC}$) (see Note 1)	$\pm 20\text{ mA}$
Output clamp current, I_{OK} ($V_O < 0$ or $V_O > V_{CC}$) (see Note 2)	$\pm 20\text{ mA}$
Operating free-air temperature range, T_A	–40°C to 85°C
Storage temperature range, T_{stg}	–65°C to 150°C

† Stresses beyond those listed under “absolute maximum ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under “recommended operating conditions” is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

NOTES: 1. Applies for external input and bidirectional buffers. $V_I > V_{CC}$ does not apply to fail-safe pins.
2. Applies for external output and bidirectional buffers. $V_O > V_{CC}$ does not apply to fail-safe pins.

recommended operating conditions

low voltage (3.3 V nominal)

		MIN	NOM	MAX	UNIT

t_{h20}	Hold time, SAD(7–0) valid after $\overline{WR}\uparrow$	30		ns
t_{dis3}	Disable time, $\overline{RD}\uparrow$ to SAD(7–0) high impedance	5	15	ns

subsystem Zilog nonmultiplexed timing requirments (see Figure 13)

		MIN	MAX	UNIT
t_{su20}	Setup time, SA(8–0), \overline{CS} , R/ \overline{W} valid to $\overline{DS}\downarrow$ (write)	90		ns
t_{su21}	Setup time, SA(8–0), \overline{CS} , R/ \overline{W} valid to $\overline{DS}\downarrow$ (read)	30		ns
t_{w20}	Pulse duration, \overline{DS} low (write)	65		ns
t_{w21}	Pulse duration, \overline{DS} low (read)	125		ns
t_{su22}	Setup time, SAD(7–0) valid to $\overline{DS}\uparrow$	50		ns
t_{en5}	Enable time, $\overline{DS}\downarrow$ to SAD(7–0) driving	5		ns
t_{d41}	Delay time, $\overline{DS}\downarrow$ to SAD(7–0) valid		105	ns
t_{h21}	Hold time, SA(8–0), \overline{CS} , R/ \overline{W} valid after $\overline{DS}\uparrow$	30		ns
t_{h22}	Hold time, SAD(7–0), \overline{CS} , R/ \overline{W} valid after $\overline{DS}\uparrow$	30		ns
t_{dis4}	Hold time, $\overline{DS}\uparrow$ to SAD(7–0) high impedance	5	15	ns

TL16PC564BLVI**PCMCIA UNIVERSAL ASYNCHRONOUS RECEIVER TRANSMITTER**

SLLS627– SEPTEMBER 2004

ARBCLK switching characteristics over recommended operating free-air temperature range (see Figure 14)

		TEST CONDITIONS	MIN	MAX	UNIT
t_{c4}	Cycle time, internal arbitration clock (ARBCLKI ÷ ARBPGM)	$V_{CC} = 3.3\text{ V}$, See Note 11	26	Note 14	ns
		$V_{CC} = 5\text{ V}$	14	Note 14	
t_{c5}	Cycle time, arbitration clock	$V_{CC} = 3.3\text{ V}$, See Note 11	26		ns
		$V_{CC} = 5\text{ V}$	14		
t_{d42}	Delay time, ARBCLKI↑ to ARBCLK0↑ (÷ 1)	$V_{CC} = 3.3\text{ V}$, See Note 11		13	ns
		$V_{CC} = 5\text{ V}$		7.3	
t_{d43}	Delay time, ARBCLKI↓ to ARBCLK0↓ (÷ 1)	$V_{CC} = 3.3\text{ V}$, See Note 11		15.5	ns
		$V_{CC} = 5\text{ V}$		10	
t_{d44}	Delay time, ARBCLKI↑ to ARBCLK0↑ (÷ 2)	$V_{CC} = 3.3\text{ V}$, See Note 11		15.3	ns
		$V_{CC} = 5\text{ V}$		8.8	
t_{d45}	Delay time, ARBCLKI↑ to ARBCLK0↓ (÷ 2)	$V_{CC} = 3.3\text{ V}$, See Note 11		17.5	ns
		$V_{CC} = 5\text{ V}$		11	
t_{d46}	Delay time, ARBCLKI↑ to ARBCLK0↑ (÷ 4)	$V_{CC} = 3.3\text{ V}$, See Note 11		19.5	ns
		$V_{CC} = 5\text{ V}$		11.5	
t_{d47}	Delay time, ARBCLKI↑ to ARBCLK0↓ (÷ 4)	$V_{CC} = 3.3\text{ V}$, See Note 11		21.5	ns
		$V_{CC} = 5\text{ V}$		13.5	
t_{d48}	Delay time, ARBCLKI↑ to ARBCLK0↑ (÷ 8)	$V_{CC} = 3.3\text{ V}$, See Note 11		22.7	ns
		$V_{CC} = 5\text{ V}$		13.5	
t_{d49}	Delay time, ARBCLKI↑ to ARBCLK0↓ (÷ 8)	$V_{CC} = 3.3\text{ V}$, See Note 11		25	ns
		$V_{CC} = 5\text{ V}$		15.7	

NOTES: 11. TL16PC564BLVI device tested at 3 V.

14. t_{c4} MAX = N/6, where N = shortest (in ns) of the two attribute-memory accesses, host CPU or subsystem.

reset timing requirements over recommended ranges of operating free-air temperature and supply voltage (unless otherwise noted) (see Figure 15)

		TEST CONDITIONS	MIN	MAX	UNIT
t_{w22}	Pulse duration, RESET active		$8 \cdot t_{c5}$		ns
t_{w23}	Pulse duration, RESET inactive		$8 \cdot t_{c5}$		ns
t_{d50}	Delay time, ARBCLKI↑ to $\overline{\text{RST}}$ low	$V_{CC} = 3.3\text{ V}$, See Note 11		10.4	ns
		$V_{CC} = 5\text{ V}$		7.5	
t_{d51}	Delay time, ARBCLKI↑ to $\overline{\text{RST}}$ high impedance	$V_{CC} = 3.3\text{ V}$, See Note 11		13.9	ns
		$V_{CC} = 5\text{ V}$		9.7	

NOTE 11: TL16PC564BLVI device tested at 3 V.

subsystem interrupt-request timing requirements over recommended ranges of operating free-air temperature and supply voltage (see Figure 16)

		MIN	MAX	UNIT
t_{d52}	Delay time, $\overline{\text{WE}}$ ↑ to IRQ↑ (see Note 15)	$2t_{c5}$	$3t_{c5}$	ARBCLKI cycles
t_{d53}	Delay time, SCR bit 6↑ to IRQ↓ (see Note 16)	t_{c5}	$2t_{c5}$	ARBCLKI cycles

NOTES: 11. TL16PC564BLVI device tested at 3 V.

15. Synchronized to rising edge of ARBCLKI

16. Synchronized to falling edge of ARBCLKI

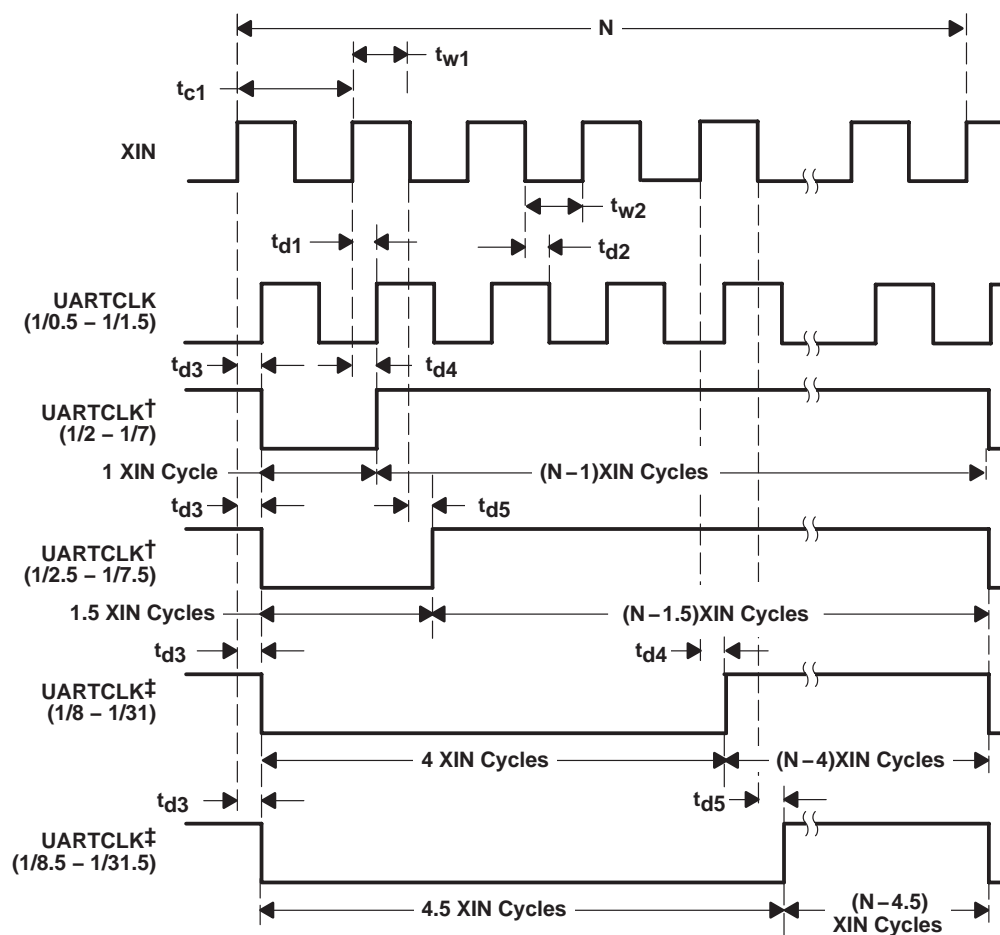

host CPU status change timing requirements over recommended ranges of operating free-air temperature and supply voltage (see Figure 17)

	MIN	MAX	UNIT
t_{d54} Delay time, subsystem write \uparrow to $\overline{STSCHG} \downarrow$ (see Note 14)	$2t_{c5}$	$3t_{c5}$	ARBCLKI cycles
t_{d55} Delay time, $\overline{OE} \downarrow$ to \overline{STSCHG} high impedance (see Note 15)	t_{c5}	$2t_{c5}$	ARBCLKI cycles

NOTES: 15. Synchronized to rising edge of ARBCLKI

16. Synchronized to falling edge of ARBCLKI

PARAMETER MEASUREMENT INFORMATION

† The low portion of the UARTCLK cycle = 1 XIN cycle for PGMCLK integer values of 2 to 7 and 1.5 XIN cycles for PGMCLK noninteger values 2.5 to 7.5.

‡ The low portion of the UARTCLK cycle = 4 XIN cycles for PGMCLK integer values of 8 to 31 and 4.5 XIN cycles for PGMCLK noninteger values 8.5 to 31.5.

PACKAGING INFORMATION

Orderable Device	Status ⁽¹⁾	Package Type	Package Drawing	Pins	Package Qty	Eco Plan ⁽²⁾	Lead/ Ball Finish	MSL Peak Temp ⁽³⁾	Samples (Requires Login)
TL16PC564BLVIPZ	NRND	LQFP	PZ	100	90	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-3-260C-168 HR	
TL16PC564BLVIPZG4	NRND	LQFP	PZ	100	90	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-3-260C-168 HR	

⁽¹⁾ The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

⁽²⁾ Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

⁽³⁾ MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

PLASTIC QUAD FLATPACK

- NOTES: A. All linear dimensions are in millimeters.
 B. This drawing is subject to change without notice.
 C. Falls within JEDEC MS-026

PZ (S-PQFP-G100)

PLASTIC QUAD FLAT PACK

NOTES:

- All linear dimensions are in millimeters.
- This drawing is subject to change without notice.
- Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Example stencil design based on a 50% volumetric metal load solder paste. Refer to IPC-7525 for other stencil recommendations.
- Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46C and to discontinue any product or service per JESD48B. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components which meet ISO/TS16949 requirements, mainly for automotive use. Components which have not been so designated are neither designed nor intended for automotive use; and TI will not be responsible for any failure of such components to meet such requirements.
