

- **Advanced Multibus Architecture With Three Separate 16-Bit Data Memory Buses and One Program Memory Bus**
- **40-Bit Arithmetic Logic Unit (ALU) Including a 40-Bit Barrel Shifter and Two Independent 40-Bit Accumulators**
- **17- × 17-Bit Parallel Multiplier Coupled to a 40-Bit Dedicated Adder for Non-Pipelined Single-Cycle Multiply/Accumulate (MAC) Operation**
- **Compare, Select, and Store Unit (CSSU) for the Add/Compare Selection of the Viterbi Operator**
- **Exponent Encoder to Compute an Exponent Value of a 40-Bit Accumulator Value in a Single Cycle**
- **Two Address Generators With Eight Auxiliary Registers and Two Auxiliary Register Arithmetic Units (ARAUs)**
- **Data Bus With a Bus Holder Feature**
- **Address Bus With a Bus Holder Feature**
- **Extended Addressing Mode for 8M × 16-Bit Maximum Addressable External Program Space**
- **192K × 16-Bit Maximum Addressable Memory Space (64K Words Program, 64K Words Data, and 64K Words I/O)**
- **On-Chip ROM with Some Configurable to Program/Data Memory**
- **Dual-Access On-Chip RAM**
- **Single-Access On-Chip RAM**
- **Single-Instruction Repeat and Block-Repeat Operations for Program Code**
- **Block-Memory-Move Instructions for Better Program and Data Management**
- **Instructions With a 32-Bit Long Word Operand**
- **Instructions With Two- or Three-Operand Reads**
- **Arithmetic Instructions With Parallel Store and Parallel Load**
- **Conditional Store Instructions**
- **Fast Return From Interrupt**
- **On-Chip Peripherals**
 - Software-Programmable Wait-State Generator and Programmable Bank Switching
 - On-Chip Phase-Locked Loop (PLL) Clock Generator With Internal Oscillator or External Clock Source
 - Time-Division Multiplexed (TDM) Serial Port
 - Buffered Serial Port (BSP)
 - 8-Bit Parallel Host-Port Interface (HPI)
 - One 16-Bit Timer
 - External-Input/Output (XIO) Off Control to Disable the External Data Bus, Address Bus and Control Signals
- **Power Consumption Control With IDLE1, IDLE2, and IDLE3 Instructions With Power-Down Modes**
- **CLKOUT Off Control to Disable CLKOUT**
- **On-Chip Scan-Based Emulation Logic, IEEE Std 1149.1† (JTAG) Boundary Scan Logic**
- **15-ns Single-Cycle Fixed-Point Instruction Execution Time (66 MIPS) for 3.3-V Power Supply**
- **12.5-ns Single-Cycle Fixed-Point Instruction Execution Time (80 MIPS) for 3.3-V Power Supply**

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

† IEEE Standard 1149.1-1990 Standard-Test-Access Port and Boundary Scan Architecture.

PRODUCTION DATA information is current as of publication date. Products conform to specifications per the terms of Texas Instruments standard warranty. Production processing does not necessarily include testing of all parameters.

description

The TMS320LC549 fixed-point, digital signal processor (DSP) (hereafter referred to as the '549) is based on an advanced modified Harvard architecture that has one program memory bus and three data memory buses. The processor also provides an arithmetic logic unit (ALU) that has a high degree of parallelism, application-specific hardware logic, on-chip memory, and additional on-chip peripherals. The '549 also utilizes a highly specialized instruction set, which is the basis of its operational flexibility and speed.

Separate program and data spaces allow simultaneous access to program instructions and data, providing the high degree of parallelism. Two reads and one write operation can be performed in a single cycle. Instructions with parallel store and application-specific instructions can fully utilize this architecture. In addition, data can be transferred between data and program spaces. Such parallelism supports a powerful set of arithmetic, logic, and bit-manipulation operations that can all be performed in a single machine cycle. In addition, the '549 includes the control mechanisms to manage interrupts, repeated operations, and function calls.

This data sheet contains the pin layouts, signal descriptions, and electrical specifications for the TMS320VC549 DSP. For additional information, see the *TMS320C54x*, *TMS320LC54x*, *TMS320VC54x Fixed-Point Digital Signal Processors* data sheet (literature number SPRS039). The SPRS039 is considered a family functional overview and should be used in conjunction with this data sheet.

TMS320LC549 FIXED-POINT DIGITAL SIGNAL PROCESSOR

TMS320LC549

FIXED-POINT DIGITAL SIGNAL PROCESSOR

SPRS077B – SEPTEMBER 1998 – REVISED FEBRUARY 2000

Signal Descriptions

TERMINAL NAME	TYPE†	DESCRIPTION
DATA SIGNALS		
A22 (MSB) A21 A20 A19 A18 A17 A16 A15 A14 A13 A12 A11 A10 A9 A8 A7 A6 A5 A4 A3 A2 A1 A0 (LSB)	O/Z	Parallel port address bus A22 (MSB) through A0 (LSB). The sixteen LSBs (A15–A0) are multiplexed to address external data/program memory or I/O. A15–A0 are placed in the high-impedance state in the hold mode. A15–A0 also go into the high-impedance state when EMU1/OFF is low. The seven MSBs (A22 to A16) are used for extended program memory addressing. The address bus have a feature called bus holder that eliminates passive components and the power dissipation associated with it. The bus holders keep the address bus at the previous logic level when the bus goes into a high-impedance state. The bus holders on the address bus are always enabled.
D15 (MSB) D14 D13 D12 D11 D10 D9 D8 D7 D6 D5 D4 D3 D2 D1 D0 (LSB)	I/O/Z	Parallel port data bus D15 (MSB) through D0 (LSB). D15–D0 are multiplexed to transfer data between the core CPU and external data/program memory or I/O devices. D15–D0 are placed in the high-impedance state when not output or when RS or HOLD is asserted. D15–D0 also go into the high-impedance state when EMU1/OFF is low. The data bus has a feature called bus holder that eliminates passive components and the power dissipation associated with it. The bus holders keep the data bus at the previous logic level when the bus goes into a high-impedance state. These bus holders are enabled or disabled by the BH bit in the bank switching control register (BSCR).
INITIALIZATION, INTERRUPT AND RESET OPERATIONS		
$\overline{\text{IACK}}$	O/Z	Interrupt acknowledge signal. $\overline{\text{IACK}}$ indicates the receipt of an interrupt and that the program counter is fetching the interrupt vector location designated by A15–0. $\overline{\text{IACK}}$ also goes into the high-impedance state when EMU1/OFF is low.
$\overline{\text{INT0}}$ $\overline{\text{INT1}}$ $\overline{\text{INT2}}$ $\overline{\text{INT3}}$	I	External user interrupt inputs. $\overline{\text{INT0}}$ – $\overline{\text{INT3}}$ are prioritized and are maskable by the interrupt mask register and the interrupt mode bit. $\overline{\text{INT0}}$ – $\overline{\text{INT3}}$ can be polled and reset by the interrupt flag register.

† I = Input, O = Output, Z = High impedance

Signal Descriptions (Continued)

TERMINAL NAME	TYPE†	DESCRIPTION
INITIALIZATION, INTERRUPT AND RESET OPERATIONS (CONTINUED)		
$\overline{\text{NMI}}$	I	Nonmaskable interrupt. $\overline{\text{NMI}}$ is an external interrupt that cannot be masked by way of the INTM or the IMR. When $\overline{\text{NMI}}$ is activated, the processor traps to the appropriate vector location.
$\overline{\text{RS}}$	I	Reset input. $\overline{\text{RS}}$ causes the DSP to terminate execution and forces the program counter to 0FF80h. When $\overline{\text{RS}}$ is brought to a high level, execution begins at location 0FF80h of the program memory. $\overline{\text{RS}}$ affects various registers and status bits.
MP/ $\overline{\text{MC}}$	I	Microprocessor/microcomputer mode-select pin. If active-low at reset (microcomputer mode), MP/ $\overline{\text{MC}}$ causes the internal program ROM to be mapped into the upper program memory space. In the microprocessor mode, off-chip memory and its corresponding addresses (instead of internal program ROM) are accessed by the DSP.
CNT	I	I/O level select. For 5-V operation, all input and output voltage levels are TTL-compatible when CNT is pulled down to a low level. For 3-V operation with CMOS-compatible I/O interface levels, CNT is pulled to a high level.
MULTIPROCESSING SIGNALS		
$\overline{\text{BIO}}$	I	Branch control input. A branch can be conditionally executed when $\overline{\text{BIO}}$ is active. If low, the processor executes the conditional instruction. The $\overline{\text{BIO}}$ condition is sampled during the decode phase of the pipeline for the XC instruction, and all other instructions sample $\overline{\text{BIO}}$ during the read phase of the pipeline.
XF	O/Z	External flag output (latched software-programmable signal). XF is set high by the SSBX XF instruction, set low by RSBX XF instruction or by loading the ST1 status register. XF is used for signaling other processors in multiprocessor configurations or as a general-purpose output pin. XF goes into the high-impedance state when $\overline{\text{OFF}}$ is low, and is set high at reset.
MEMORY CONTROL SIGNALS		
$\overline{\text{DS}}$ $\overline{\text{PS}}$ $\overline{\text{IS}}$	O/Z	Data, program, and I/O space select signals. $\overline{\text{DS}}$, $\overline{\text{PS}}$, and $\overline{\text{IS}}$ are always high unless driven low for communicating to a particular external space. Active period corresponds to valid address information. Placed into a high-impedance state in hold mode. $\overline{\text{DS}}$, $\overline{\text{PS}}$, and $\overline{\text{IS}}$ also go into the high-impedance state when EMU1/ $\overline{\text{OFF}}$ is low.
$\overline{\text{MSTRB}}$	O/Z	Memory strobe signal. $\overline{\text{MSTRB}}$ is always high unless low-level asserted to indicate an external bus access to data or program memory. Placed in high-impedance state in hold mode. $\overline{\text{MSTRB}}$ also goes into the high-impedance state when $\overline{\text{OFF}}$ is low.
READY	I	Data-ready input. READY indicates that an external device is prepared for a bus transaction to be completed. If the device is not ready (READY is low), the processor waits one cycle and checks READY again. Note that the processor performs ready-detection if at least two software wait states are programmed. The READY signal is not sampled until the completion of the software wait states.
R/ $\overline{\text{W}}$	O/Z	Read/write signal. R/ $\overline{\text{W}}$ indicates transfer direction during communication to an external device and is normally high (in read mode), unless asserted low when the DSP performs a write operation. Placed in the high-impedance state in hold mode, R/ $\overline{\text{W}}$ also goes into the high-impedance state when EMU1/ $\overline{\text{OFF}}$ is low.
$\overline{\text{IOSTRB}}$	O/Z	I/O strobe signal. $\overline{\text{IOSTRB}}$ is always high unless low level asserted to indicate an external bus access to an I/O device. Placed in high-impedance state in hold mode. $\overline{\text{IOSTRB}}$ also goes into the high-impedance state when EMU1/ $\overline{\text{OFF}}$ is low.
$\overline{\text{HOLD}}$	I	Hold input. $\overline{\text{HOLD}}$ is asserted to request control of the address, data, and control lines. When acknowledged by the '54x, these lines go into high-impedance state.
$\overline{\text{HOLDA}}$	O/Z	Hold acknowledge signal. $\overline{\text{HOLDA}}$ indicates to the external circuitry that the processor is in a hold state and that the address, data, and control lines are in a high-impedance state, allowing them to be available to the external circuitry. $\overline{\text{HOLDA}}$ also goes into the high-impedance state when EMU1/ $\overline{\text{OFF}}$ is low.
$\overline{\text{MSC}}$	O/Z	Microstate complete signal. Goes low on CLKOUT falling at the start of the first software wait state. Remains low until one CLKOUT cycle before the last programmed software wait state. If connected to the READY line, $\overline{\text{MSC}}$ forces one external wait state after the last internal wait state has been completed. $\overline{\text{MSC}}$ also goes into the high-impedance state when EM1/ $\overline{\text{OFF}}$ is low.

† I = Input, O = Output, Z = High impedance

TMS320LC549

FIXED-POINT DIGITAL SIGNAL PROCESSOR

SPRS077B – SEPTEMBER 1998 – REVISED FEBRUARY 2000

Signal Descriptions (Continued)

TERMINAL NAME	TYPE†	DESCRIPTION
MEMORY CONTROL SIGNALS (CONTINUED)		
$\overline{\text{IAQ}}$	O/Z	Instruction acquisition signal. $\overline{\text{IAQ}}$ is asserted (active low) when there is an instruction address on the address bus and goes into the high-impedance state when EMU1/ $\overline{\text{OFF}}$ is low.
OSCILLATOR/TIMER SIGNALS		
CLKOUT	O/Z	Master clock output signal. CLKOUT cycles at the machine-cycle rate of the CPU. The internal machine cycle is bounded by the falling edges of this signal. CLKOUT also goes into the high-impedance state when EMU1/ $\overline{\text{OFF}}$ is low.
CLKMD1 CLKMD2 CLKMD3	I	Clock mode external/internal input signals. CLKMD1, CLKMD2, and CLKMD3 allow you to select and configure different clock modes, such as crystal, external clock, and various PLL factors. Refer to PLL section for a detailed functional description of these pins.
X2/CLKIN	I	Input pin to internal oscillator from the crystal. If the internal (crystal) oscillator is not being used, a clock can become input to the device using this pin. The internal machine cycle time is determined by the clock operating-mode pins (CLKMD1, CLKMD2 and CLKMD3).
X1	O	Output pin from the internal oscillator for the crystal. If the internal oscillator is not used, X1 should be left unconnected. X1 does not go into the high-impedance state when EMU1/ $\overline{\text{OFF}}$ is low.
TOUT	O/Z	Timer output. TOUT signals a pulse when the on-chip timer counts down past zero. The pulse is a CLKOUT-cycle wide. TOUT also goes into the high-impedance state when EMU1/ $\overline{\text{OFF}}$ is low.
BUFFERED SERIAL PORT 0 AND BUFFERED SERIAL PORT 1 SIGNALS		
BCLKR0 BCLKR1	I	Receive clocks. External clock signal for clocking data from the data-receive (DR) pin into the buffered serial port receive shift registers (RSRs). Must be present during buffered serial port transfers. If the buffered serial port is not being used, BCLKR0 and BCLKR1 can be sampled as an input by way of IN0 bit of the SPC register.
BCLKX0 BCLKX1	I/O/Z	Transmit clock. Clock signal for clocking data from the serial port transmit shift register (XSR) to the data transmit (DX) pin. BCLKX can be an input if MCM in the serial port control register is cleared to 0. It also can be driven by the device at $1/(\text{CLKDV} + 1)$ where CLKDV range is 0–31 CLKOUT frequency when MCM is set to 1. If the buffered serial port is not used, BCLKX can be sampled as an input by way of IN1 of the SPC register. BCLKX0 and BCLKX1 go into the high-impedance state when $\overline{\text{OFF}}$ is low.
BDR0 BDR1	I	Buffered serial-data-receive input. Serial data is received in the RSR by BDR0/BDR1.
BDX0 BDX1	O/Z	Buffered serial-port-transmit output. Serial data is transmitted from the XSR by way of BDX. BDX0 and BDX1 are placed in the high-impedance state when not transmitting and when EMU1/ $\overline{\text{OFF}}$ is low.
BFSR0 BFSR1	I	Frame synchronization pulse for receive input. The falling edge of the BFSR pulse initiates the data-receive process, beginning the clocking of the RSR.
BFSX0 BFSX1	I/O/Z	Frame synchronization pulse for transmit input/output. The falling edge of the BFSX pulse initiates the data-transmit process, beginning the clocking of the XSR. Following reset, the default operating condition of BFSX is an input. BFSX0 and BFSX1 can be selected by software to be an output when TXM in the serial control register is set to 1. This pin goes into the high-impedance state when EMU1/ $\overline{\text{OFF}}$ is low.
SERIAL PORT 0 AND SERIAL PORT 1 SIGNALS		
CLKR0 CLKR1	I	Receive clocks. External clock signal for clocking data from the data receive (DR) pin into the serial port receive shift register (RSR). Must be present during serial port transfers. If the serial port is not being used, CLKR0 and CLKR1 can be sampled as an input via IN0 bit of the SPC register.
CLKX0 CLKX1	I/O/Z	Transmit clock. Clock signal for clocking data from the serial port transmit shift register (XSR) to the data transmit (DX) pin. CLKX can be an input if MCM in the serial port control register is cleared to 0. It also can be driven by the device at $1/4$ CLKOUT frequency when MCM is set to 1. If the serial port is not used, CLKX can be sampled as an input via IN1 of the SPC register. CLKX0 and CLKX1 go into the high-impedance state when EMU1/ $\overline{\text{OFF}}$ is low.
DR0 DR1	I	Serial-data-receive input. Serial data is received in the RSR by DR.

† I = Input, O = Output, Z = High impedance

Signal Descriptions (Continued)

TERMINAL NAME	TYPE†	DESCRIPTION
SERIAL PORT 0 AND SERIAL PORT 1 SIGNALS (CONTINUED)		
DX0 DX1	O/Z	Serial port transmit output. Serial data is transmitted from the XSR via DX. DX0 and DX1 are placed in the high-impedance state when not transmitting and when EMU1/OFF is low.
FSR0 FSR1	I	Frame synchronization pulse for receive input. The falling edge of the FSR pulse initiates the data-receive process, beginning the clocking of the RSR.
FSX0 FSX1	I/O/Z	Frame synchronization pulse for transmit input/output. The falling edge of the FSX pulse initiates the data transmit process, beginning the clocking of the XSR. Following reset, the default operating condition of FSX is an input. FSX0 and FSX1 can be selected by software to be an output when TXM in the serial control register is set to 1. This pin goes into the high-impedance state when EMU1/OFF is low.
TDM SERIAL PORT SIGNALS		
TCLKR	I	TDM receive clock input
TDR	I	TDM serial data-receive input
TF SR/TADD	I/O	TDM receive frame synchronization or TDM address
TCLKX	I/O/Z	TDM transmit clock
TDX	O/Z	TDM serial data-transmit output
TF SX/TFRM	I/O/Z	TDM transmit frame synchronization
HOST-PORT INTERFACE SIGNALS		
HD0–HD7	I/O/Z	Parallel bidirectional data bus. HD0–HD7 are placed in the high-impedance state when not outputting data. The signals go into the high-impedance state when EMU1/OFF is low. These pins each have bus holders similar to those on the address/data bus, but which are always enabled.
HCNTL0 HCNTL1	I	Control inputs
HBIL	I	Byte-identification input
HCS	I	Chip-select input
HDS1 HDS2	I	Data strobe inputs
HAS	I	Address strobe input
HR/W	I	Read/write input
HRDY	O/Z	Ready output. This signal goes into the high-impedance state when EMU1/OFF is low.
HINT	O/Z	Interrupt output. When the DSP is in reset, this signal is driven high. The signal goes into the high-impedance state when EMU1/OFF is low.
HPIENA	I	HPI module select input. This signal must be tied to a logic 1 state to have HPI selected. If this input is left open or connected to ground, the HPI module will not be selected, internal pullup for the HPI input pins are enabled, and the HPI data bus has keepers set. This input is provided with an internal pull-down resistor which is active only when RS is low. HPIENA is sampled when RS goes high and ignored until RS goes low again. Refer to the Electrical Characteristics section for the input current requirements for this pin.
SUPPLY PINS		
CVDD	Supply	+VDD. CVDD is the dedicated power supply for the core CPU.
DVDD	Supply	+VDD. DVDD is the dedicated power supply for I/O pins.
VSS	Supply	Ground. VSS is the dedicated power ground for the device.

† I = Input, O = Output, Z = High impedance

TMS320LC549

FIXED-POINT DIGITAL SIGNAL PROCESSOR

SPRS077B – SEPTEMBER 1998 – REVISED FEBRUARY 2000

Signal Descriptions (Continued)

TERMINAL NAME	TYPE†	DESCRIPTION
IEEE1149.1 TEST PINS		
TCK	I	IEEE standard 1149.1 test clock. Pin with internal pullup device. This is normally a free-running clock signal with a 50% duty cycle. The changes on the test-access port (TAP) of input signals TMS and TDI are clocked into the TAP controller, instruction register, or selected test data register on the rising edge of TCK. Changes at the TAP output signal (TDO) occur on the falling edge of TCK.
TDI	I	IEEE standard 1149.1 test data input. Pin with internal pullup device. TDI is clocked into the selected register (instruction or data) on a rising edge of TCK.
TDO	O/Z	IEEE standard 1149.1 test data output. The contents of the selected register (instruction or data) is shifted out of TDO on the falling edge of TCK. TDO is in the high-impedance state except when the scanning of data is in progress. TDO also goes into the high-impedance state when EMU1/OFF is low.
TMS	I	IEEE standard 1149.1 test mode select. Pin with internal pullup device. This serial control input is clocked into the TAP controller on the rising edge of TCK.
$\overline{\text{TRST}}$	I	IEEE standard 1149.1 test reset. $\overline{\text{TRST}}$, when high, gives the IEEE standard 1149.1 scan system control of the operations of the device. If $\overline{\text{TRST}}$ is not connected or driven low, the device operates in its functional mode, and the IEEE standard 1149.1 signals are ignored. Pin with internal pulldown device.
EMU0	I/O/Z	Emulator interrupt 0 pin. When $\overline{\text{TRST}}$ is driven low, EMU0 must be high for the activation of the EMU1/OFF condition. When $\overline{\text{TRST}}$ is driven high, EMU0 is used as an interrupt to or from the emulator system and is defined as input/output by way of IEEE standard 1149.1 scan system.
EMU1/ $\overline{\text{OFF}}$	I/O/Z	Emulator interrupt 1 pin/disable all outputs. When $\overline{\text{TRST}}$ is driven high, EMU1/ $\overline{\text{OFF}}$ is used as an interrupt to or from the emulator system and is defined as input/output by way of IEEE standard 1149.1 scan system. When $\overline{\text{TRST}}$ is driven low, EMU1/ $\overline{\text{OFF}}$ is configured as $\overline{\text{OFF}}$. The EMU1/ $\overline{\text{OFF}}$ signal, when active low, puts all output drivers into the high-impedance state. Note that $\overline{\text{OFF}}$ is used exclusively for testing and emulation purposes (not for multiprocessing applications). Therefore, for the $\overline{\text{OFF}}$ condition, the following conditions apply: $\overline{\text{TRST}}$ = low, EMU0 = high EMU1/ $\overline{\text{OFF}}$ = low
DEVICE TEST PIN		
TEST1	I	Test1 – Reserved for internal use only. This pin must not be connected (NC).

† I = Input, O = Output, Z = High impedance

absolute maximum ratings over specified temperature range (unless otherwise noted)[†]

Supply voltage, DV_{DD} [‡]	–0.3 V to 4.6 V
Input voltage range	–0.3 V to 4.6 V
Output voltage range	–0.3 V to 4.6 V
Operating case temperature range, T_C	–40°C to 100°C
Storage temperature range, T_{stg}	–55°C to 150°C

[†] Stresses beyond those listed under “absolute maximum ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under “recommended operating conditions” is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

[‡] All voltage values are with respect to V_{SS} .

recommended operating conditions

			MIN	NOM	MAX	UNIT

[§] The following pins have schmitt trigger inputs: RS, \overline{INTn} , \overline{NMI} , X2/CLKIN, CLKMDn, TCK, HAS, HCS, HDSn, BCLKRn, TCLKR, BCLKXn, and TCLKX

Refer to Figure 1 for 3.3-V device test load circuit values.

PARAMETER MEASUREMENT INFORMATION

timing parameter symbology

Timing parameter symbols used are created in accordance with JEDEC Standard 100-A. To shorten the symbols, some of the pin names and other related terminology have been abbreviated as follows:

Lowercase subscripts and their meanings:

a	access time
c	cycle time (period)
d	delay time
dis	disable time
en	enable time
f	fall time
h	hold time
r	rise time
su	setup time
t	transition time
v	valid time
w	pulse duration (width)
X	Unknown, changing, or don't care level

Letters and symbols and their meanings:

H	High
L	Low
V	Valid
Z	High impedance

signal transition reference points

All timing references are made at a voltage of 1.5 volts, except rise and fall times which are referenced at the 10% and 90% points of the specified low and high logic levels, respectively.

Where: I_{OL} = 1.5 mA (all outputs)
 I_{OH} = 300 μ A (all outputs)
 V_{Load} = 1.5 V
 C_T = 40 pF typical load circuit capacitance.

† All values are typical unless otherwise specified.

‡ All input and output voltage levels except RS, INT0 – INT3, NMI, CNT, X2/CLKIN, CLKMD0 – CLKMD3 are LVTTTL-compatible.

§ Clock mode: PLL × 1 with external source

¶ This value was obtained with 50% usage of MAC and 50% usage of NOP instructions. Actual operating current varies with program being executed.

This value was obtained with single-cycle external writes, CLKOFF = 0 and load = 15 pF. For more details on how this calculation is performed, refer to the *Calculation of TMS320C54x Power Dissipation* application report (literature number SPRA164).

|| HPI input signals except for HPIENA.

☆ V_{IL(MIN)} ≤ V_I ≤ V_{IL(MAX)} or V_{IH(MIN)} ≤ V_I ≤ V_{IH(MAX)}

TMS320LC549

FIXED-POINT DIGITAL SIGNAL PROCESSOR

SPRS077B – SEPTEMBER 1998 – REVISED FEBRUARY 2000

internal oscillator with external crystal

The internal oscillator is enabled by selecting the appropriate clock mode at reset (this is device-dependent – see PLL section) and connecting a crystal or ceramic resonator across X1 and X2/CLKIN. The CPU clock frequency is one-half the crystal's oscillation frequency following reset. After reset, the clock mode of the devices with the software PLL can also be changed to divide-by-four. Since the internal oscillator can be used as a clock source to the PLL, the crystal oscillation frequency can be multiplied to generate the CPU clock if desired.

The crystal should be in fundamental mode operation and parallel resonant with an effective series resistance of 30ohms and power dissipation of 1 mW. The connection of the required circuit, consisting of the crystal and two load capacitors, is shown in Figure 2. The load capacitors, C₁ and C₂, should be chosen such that the equation below is satisfied. C_L in the equation is the load specified for the crystal.

$$C_L = \frac{C_1 C_2}{(C_1 + C_2)}$$

recommended operating conditions (see Figure 2)

	'549-66			'549-80			UNIT
	MIN	NOM	MAX	MIN	NOM	MAX	
f _x Input clock frequency	10†		20‡	10†		20‡	MHz

† This device utilizes a fully static design and therefore can operate with t_{C(C1)} approaching ∞. The device is characterized at frequencies approaching 0 Hz.

‡ It is recommended that the PLL clocking option be used for maximum frequency operation.

Figure 2. Internal Divide-by-Two Clock Option With External Crystal

divide-by-two/divide-by-four clock option – PLL disabled

The frequency of the reference clock provided at the X2/CLKIN pin can be divided by a factor of two or four to generate the internal machine cycle. The selection of the clock mode is described in the clock generator section.

When an external clock source is used, the frequency injected must conform to specifications listed in the timing requirements table.

switching characteristics over recommended operating conditions [$H = 0.5t_{c(CO)}$] (see Figure 2 and Figure 3, and the recommended operating conditions table)

$t_{\text{su}}(\text{RS})$	Setup time, $\overline{\text{RS}}$ before X2/CLKIN low [§]	5		5		ns
$t_{\text{su}}(\text{BIO})$	Setup time, $\overline{\text{BIO}}$ before CLKOUT low	10	2H	10	2H	ns
$t_{\text{su}}(\text{INT})$	Setup time, $\overline{\text{INTn}}$, $\overline{\text{NMI}}$, $\overline{\text{RS}}$ before CLKOUT low	10	2H	10	2H	ns
$t_{\text{su}}(\text{MPMC})$	Setup time, $\text{MP}/\overline{\text{MC}}$ before CLKOUT low	10		10		ns

[†] The external interrupts ($\overline{\text{INT0}} - \overline{\text{INT3}}$, $\overline{\text{NMI}}$) are synchronized to the core CPU by way of a two flip-flop synchronizer which samples these inputs with consecutive falling edges of CLKOUT. The input to the interrupt pins is required to represent a 1–0–0 sequence at the timing that is corresponding to three CLKOUTs sampling sequence.

[‡] If the PLL mode is selected, then at power-on sequence, or at wakeup from IDLE3, $\overline{\text{RS}}$ must be held low for at least 50 μs to assure synchronization and lock-in of the PLL.

[§] Divide-by-two mode

[¶] Note that $\overline{\text{RS}}$ may cause a change in clock frequency, therefore changing the value of H (see the PLL section).

$t_r(SCK)$ Rise time, serial port clock		6		6	ns
$t_w(SCK)$ Pulse duration, serial port clock low/high	3H		3H		ns

† The serial port design is fully static and, therefore, can operate with $t_c(SCK)$ approaching ∞ . It is characterized approaching an input frequency of 0 Hz but tested at a much higher frequency to minimize test time.

‡ If the FSX pulse does not meet this specification, the first bit of serial data is driven on DX until the falling edge of FSX. After the falling edge of FSX, data is shifted out on DX pin. The transmit buffer-empty interrupt is generated when the $t_h(FSX)$ and $t_h(FSX)H$ specification is met.

NOTE 1: Internal clock with external FSX and vice versa are also allowable. However, FSX timings to CLKX always are defined depending on the source of FSX, and CLKX timings always are dependent upon the source of CLKX. Specifically, the relationship of FSX to CLKX is independent of the source of CLKX.

$t_c(\text{SCK})$ Cycle time, serial-port clock	16H [†]	‡	16H [†]	‡	ns
$t_f(\text{SCK})$ Fall time, serial-port clock		6		6	ns
$t_r(\text{SCK})$ Rise time, serial-port clock		6		6	ns
$t_w(\text{SCK})$ Pulse duration, serial-port clock low/high	8H [†]		8H [†]		ns

[†] When SCK is generated internally, this value is typical.

[‡] The serial-port design is fully static and, therefore, can operate with $t_c(\text{SCK})$ approaching ∞ . It is characterized approaching an input frequency of 0 Hz but tested as a much higher frequency to minimize test time.

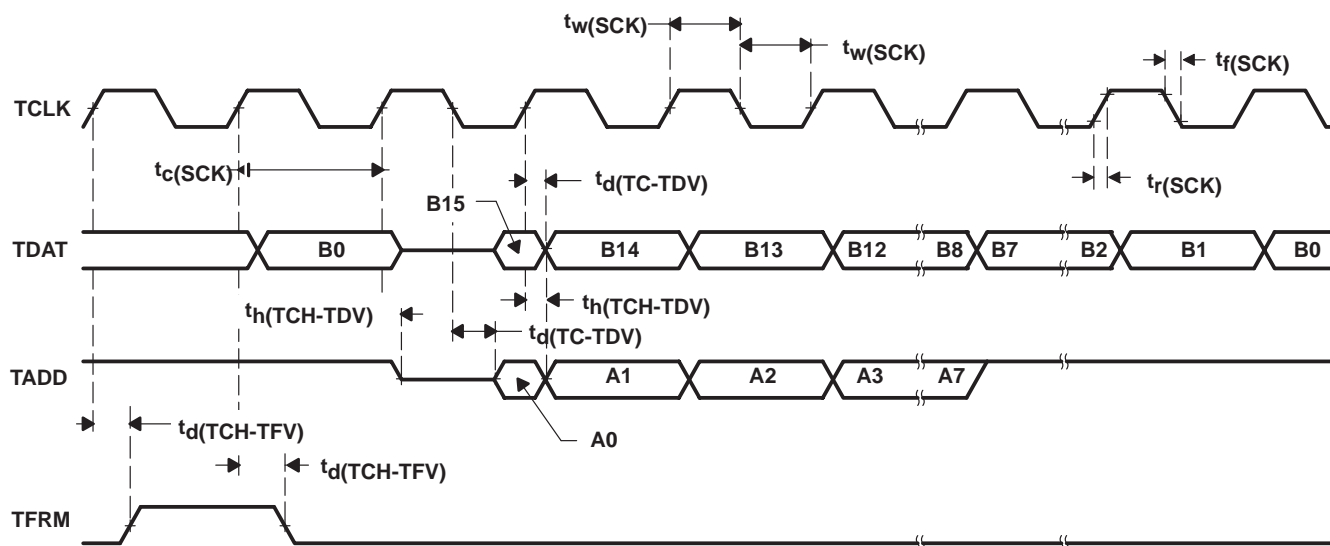

Figure 28. Serial-Port Transmit Timing in TDM Mode

TMS320LC549

FIXED-POINT DIGITAL SIGNAL PROCESSOR

SPRS077B – SEPTEMBER 1998 – REVISED FEBRUARY 2000

host-port interface timing

switching characteristics over recommended operating conditions [$H = 0.5t_{c(CO)}$]
(see Notes 5 and 6) (see Figure 29 through Figure 32)

PARAMETER		'549-66		UNIT
		MIN	MAX	
t _d (DSL-HDV)	Delay time, $\overline{\text{DS}}$ low to HD driven	5	12	ns
t _d (HEL-HDV1)	Delay time, HDS falling to HD valid for first byte of a non-subsequent read: → max 20 ns ^{†‡}	Case 1: Shared-access mode if t _w (DSH) < 7H	7H+20–t _w (DSH)	ns
		Case 2: Shared-access mode if t _w (DSH) > 7H	20	
		Case 3: Host-only mode if t _w (DSH) < 20 ns	40–t _w (DSH)	
		Case 4: Host-only mode if t _w (DSH) > 20 ns	20	
t _d (DSL-HDV2)	Delay time, $\overline{\text{DS}}$ low to HD valid, second byte	5 [‡]	20	ns
t _d (DSH-HYH)	Delay time, $\overline{\text{DS}}$ high to HRDY high		10H+10	ns
t _{su} (HDV-HYH)	Setup time, HD valid before HRDY rising edge	3H–10		ns
t _h (DSH-HDV)R	Hold time, HD valid after $\overline{\text{DS}}$ rising edge, read	0	12	ns
t _d (COH-HYH)	Delay time, CLKOUT rising edge to HRDY high		10	ns
t _d (DSH-HYL)	Delay time, $\overline{\text{HDS}}$ or $\overline{\text{HCS}}$ high to HRDY low		12	ns
t _d (COH-HTX)	Delay time, CLKOUT rising edge to $\overline{\text{HINT}}$ change		15	ns

† Host-only mode timings apply for read accesses to HPIC or HPIA, write accesses to BOB, and resetting DSPINT or HINT to 0 in shared-access mode. HRDY does not go low for these accesses.

‡ Shared-access mode timings will be met automatically if HRDY is used.

NOTES: 5. SAM = shared-access mode, HOM = host-only mode

HAD stands for HCNTRL0, HCNTRL1, and HR/W.

HDS refers to either HDS1 or HDS2.

DS refers to the logical OR of HCS and HDS.

6. On host read accesses to the HPI, the setup time of HD before $\overline{\text{DS}}$ rising edge depends on the host waveforms and cannot be specified here.

host-port interface timing (continued)

switching characteristics over recommended operating conditions [H = 0.5t_{c(CO)}]
(see Notes 5 and 6) (see Figure 29 through Figure 32) (continued)

PARAMETER		'549-80		UNIT
		MIN	MAX	
t _d (DSL-HDV)	Delay time, \overline{DS} low to HD driven	5	12	ns
t _d (HEL-HDV1)	Delay time, HDS falling to HD valid for first byte of a non-subsequent read: → max 20 ns ^{†‡}	Case 1: Shared-access mode if t _w (DSH) < 7H	7H+20–t _w (DSH)	ns
		Case 2: Shared-access mode if t _w (DSH) > 7H	20	
		Case 3: Host-only mode if t _w (DSH) < 20 ns	40–t _w (DSH)	
		Case 4: Host-only mode if t _w (DSH) > 20 ns	20	
t _d (DSL-HDV2)	Delay time, \overline{DS} low to HD valid, second byte	5 [‡]	20	ns
t _d (DSH-HYH)	Delay time, \overline{DS} high to HRDY high	10H+10		ns
t _{su} (HDV-HYH)	Setup time, HD valid before HRDY rising edge	3H–10		ns
t _h (DSH-HDV)R	Hold time, HD valid after \overline{DS} rising edge, read	0	12	ns
t _d (COH-HYH)	Delay time, CLKOUT rising edge to HRDY high	10		ns
t _d (DSH-HYL)	Delay time, \overline{HDS} or \overline{HCS} high to HRDY low	12		ns
t _d (COH-HTX)	Delay time, CLKOUT rising edge to \overline{HINT} change	15		ns

[†] Host-only mode timings apply for read accesses to HPIC or HPIA, write accesses to BOB, and resetting DSPINT or HINT to 0 in shared-access mode. HRDY does not go low for these accesses.

[‡] Shared-access mode timings will be met automatically if HRDY is used.

NOTES: 5. SAM = shared-access mode, HOM = host-only mode

HAD stands for HCNTL0, HCNTL1, and HR/W.

\overline{HDS} refers to either $\overline{HDS1}$ or $\overline{HDS2}$.

\overline{DS} refers to the logical OR of \overline{HCS} and \overline{HDS} .

6. On host read accesses to the HPI, the setup time of HD before \overline{DS} rising edge depends on the host waveforms and cannot be specified here.

TMS320LC549

FIXED-POINT DIGITAL SIGNAL PROCESSOR

SPRS077B – SEPTEMBER 1998 – REVISED FEBRUARY 2000

host-port interface timing (continued)

timing requirements [$H = 0.5t_{c(CO)}$] (see Note 5, Figure 29 through Figure 32)

		'549-66		'549-80		UNIT
		MIN	MAX	MIN	MAX	
$t_{su}(HBV-DSL)$	Setup time, HAD/HBIL valid before \overline{DS} or \overline{HAS} falling edge	10		10		ns
$t_h(DSL-HBV)$	Hold time, HAD/HBIL valid after \overline{DS} or \overline{HAS} falling edge	5		5		ns
$t_{su}(HSL-DSL)$	Setup time, \overline{HAS} low before \overline{DS} falling edge	12		12		ns
$t_w(DSL)$	Pulse duration, \overline{DS} low	30 [†]		30 [†]		ns
$t_w(DSH)$	Pulse duration, \overline{DS} high	10		10		ns
$t_c(DSH-DSH)^{\ddagger}$	Cycle time, \overline{DS} rising edge to next \overline{DS} rising edge	Case 1: HOM access timings (see Access Timing Without HRDY)		50	50	ns
		Case 2a: SAM accesses and HOM active writes to DSPINT or HINT. (see Access Timings With HRDY)		10H	10H	
$t_{su}(HDV-DSH)$	Setup time, HD valid before \overline{DS} rising edge	12		12		ns
$t_d(DSH-HSL)^{\ddagger}$	Delay time, \overline{DS} high to next \overline{HAS} low	10H		10H		ns
$t_h(DSH - HDV)W$	Hold time, HD valid after \overline{DS} rising edge, write	3		3		ns

[†] A host not using HRDY should meet the 10H requirement all the time unless a software handshake is used to change the access rate according to the HPI mode.

[‡] Must only be met if \overline{HAS} is going low when not accessing the HPI (as would be the case where multiple devices are being driven by one host).

NOTE 5: SAM = shared-access mode, HOM = host-only mode

HAD stands for HCNTROL0, HCNTRL1, and HR/W.

HDS refers to either HDS1 or HDS2.

DS refers to the logical OR of HCS and HDS.

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) Only one of markings shown within the brackets will appear on the physical device.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
