SPNS016C - NOVEMBER 1992 - REVISED FEBRUARY 1997

functional block diagram

description

The TMS370C040A, TMS370C042A, TMS370C340A, TMS370C342A, TMS370C742A, and SE370C742A devices are members of the TMS370 family of single-chip 8-bit microcontrollers. Unless otherwise noted, the term TMS370Cx4x refers to these devices. TMS370 family provides cost-effective real-time system control through integration of advanced peripheral function modules and various on-chip memory configurations.

The TMS370Cx4x family is implemented using high-performance silicon-gate CMOS EPROM and EEPROM technology. The low-operating power, wide-operating temperature range, and noise immunity of CMOS technology coupled with the high performance and extensive on-chip peripheral functions make the TMS370Cx4x devices attractive in system designs for automotive electronics, industrial motor, computer peripheral control, telecommunications, and consumer applications.

The TMS370Cx4x devices contain the following on-chip peripheral modules:

- Eight-channel (for 44 pin device) or four-channel (for 40-pin device) 8-bit analog-to-digital converter 1 (ADC1)
- Serial communications interface 1 (SCI1)
- Two 16-bit general-purpose timers (one with an 8-bit prescaler)

All trademarks are the property of their respective owners.

SPNS016C - NOVEMBER 1992 - REVISED FEBRUARY 1997

description (continued)

• One 24-bit general-purpose watchdog timer

Table 1. Memory Configurations

[†] The NJ designator for the 40-pin plastic shrink DIP package was known formerly as the N2. The mechanical drawing of the NJ is identical to the N2 package and did not need to be requalified.

[‡] System evaluators and development tools are for use only in a prototype environment, and their reliability has not been characterized.

The suffix letter (A) appended to the device name (shown in the first column of Table 1) indicates the configuration of the device. ROM and EPROM devices have different configurations as indicated in Table 2. ROM devices with the suffix letter A are configured through a programmable contact during manufacture.

Table 2. Suffix Letter Configuration

DEVICE	WATCHDOG TIMER	CLOCK	LOW-POWER MODE		
EPROM A	Standard	Divide-by-4 (standard oscillator)	Enabled		
	Standard				
ROM A	Hard	Divide-by-4 (standard oscillator)	Enabled or disabled		
	Simple				

The 4K bytes and 8K bytes of mask-programmable ROM in the TMS370C040A, TMS370C042A, TMS370C340A and TMS370C342A are replaced in the TMS370C742 with 8K bytes of EPROM while all other available memory and on-chip peripherals are identical, with the exception of no data EEPROM on the TMS370C340A and TMS370C342A devices. The OTP (TMS370C742A) device and the reprogrammable device (SE370C742A) are available.

TMS370C742A (OTP) devices are available in plastic packages. This microcontroller is effective to use for immediate production updates for other members of the TMS370Cx4x family or for low-volume production runs when the mask charge or cycle time for the low-cost mask ROM devices is not practical.

description (continued)

The SE370C742A has a windowed ceramic package to allow reprogramming of the program EPROM memory during the development/prototyping phase of design. The SE370C742A device allows quick updates to breadboards and prototype systems while iterating initial designs.

The TMS370Cx4x family provides two low-power modes (STANDBY and HALT) for applications where low-power consumption is critical. Both modes stop all central processing unit (CPU) activity (that is, no instructions are executed). In the STANDBY mode, the internal oscillator and the general-purpose timer remain active. In the HALT mode, all device activity is stopped. The device retains all RAM data and peripheral configuration bits throughout both low-power modes.

The TMS370Cx4x features advanced register-to-register architecture that allows arithmetic and logical operations without requiring an accumulator (e.g., ADD R24, R47; add the contents of register 24 to the contents of register 47 and store the result in register 47). The TMS370Cx4x family is fully instruction-set-compatible, allowing easy transition between members of the TMS370 8-bit microcontroller family.

The TMS370Cx4x family offers an 8-channel ADC1 with 8-bit accuracy for the 44-pin PLCC packages and also offers a 4-channel ADC1 for the 40-pin DIP packages. The $33-\mu s$ conversion time at 5-MHz SYSCLK and the variable sample period, combined with selectable positive reference voltage sources, turn analog signals into digital data.

The serial communications interface 1 (SCI1) module is a built-in serial interface that can be programmed to be asynchronous or isosynchronous to give two methods of serial communications. The SCI allows standard RS-232-C communications with other common data transmission equipment. The CPU takes no part in serial communications except to write data to be transmitted to a register and to read data received from a register.

The TMS370Cx4x family provides the system designer with very economical, efficient solutions to real-time control applications. The TMS370 family extended development system (XDS[™]) and compact development tool (CDT[™]) solve the challenge of efficiently developing the software and hardware required to design the TMS370Cx4x into an ever-increasing number of complex applications. The application source code can be written in assembly and C languages, and the output code can be generated by the linker. The TMS370 family XDS communicates through a standard RS-232-C interface with a personal computer, allowing use of the personal computer editors and software utilities already familiar to the designer. The TMS370 family XDS emphasizes ease-of-use through extensive use of menus and screen windowing so that a system designer with minimal training can begin developing software. Precise real-time in-circuit emulation and extensive symbolic debug and analysis tools ensure efficient software and hardware implementation, as well as reduced time-to-market cycle.

The TMS370Cx4x family together with the TMS370 family XDS, CDT370, starter kit, software tools, the SE370C742A reprogrammable devices, comprehensive product documentation, and customer support provide a complete solution for the needs of the system designer.

SPNS016C - NOVEMBER 1992 - REVISED FEBRUARY 1997

central processing unit (CPU)

The CPU used on the TMS370Cx4x device is the high-performance 8-bit TMS370 CPU module. The 'x4x implements an efficient register-to-register architecture that eliminates the conventional accumulator bottleneck. The complete 'x4x instruction map is shown in Table 17 in the TMS370Cx4x instruction set overview section.

The '370Cx4x CPU architecture provides the following components:

- CPU registers:
 - A stack pointer (SP) that points to the last entry in the memory stack
 - A status register (ST) that monitors the operation of the instructions and contains the global-interrupt-enable bits
 - A program counter (PC) that points to the memory location of the next instruction to be executed

Figure 1 illustrates the CPU registers and memory blocks.

[†] Reserved means the address space is reserved for future expansion.

[‡] Not available means the address space is not accessible.

Figure 1. Programmer's Model

SPNS016C - NOVEMBER 1992 - REVISED FEBRUARY 1997

central processing unit (CPU) (continued)

- A memory map that includes:
 - 256-byte general-purpose RAM that can be used for data memory storage, program instructions, general-purpose registers, or the stack
 - A peripheral file that provides access to all internal peripheral modules, system-wide control functions and EEPROM/EPROM programming control
 - 256-byte EEPROM module that provides in-circuit programmability and data retention in power-off conditions
 - 4K- or 8K-byte ROM or 8K-byte EPROM program memory

stack pointer (SP)

The SP is an 8-bit CPU register. The stack operates as a last-in, first-out, read/write memory. The stack is used typically to store the return address on subroutine calls as well as the status-register contents during interrupt sequences.

The SP points to the last entry or top of the stack. The SP is incremented automatically before data is pushed onto the stack and decremented after data is popped from the stack. The stack can be placed anywhere in the on-chip RAM memory.

status register (ST)

The ST monitors the operation of the instructions and contains the global interrupt-enable bits. The ST includes four status bits (condition flags) and two interrupt-enable bits:

- The four status bits indicate the outcome of the previous instruction; conditional instructions (for example, the conditional jump instructions) use the status bits to determine program flow.
- The two interrupt-enable bits control the two interrupt levels.

The ST register, status-bit notation, and status-bit definitions are shown in Table 3.

Table 3. Status Registers

7	6	5	4	3	2	1	0
С	N	Z	V	IE2	IE1	Reserved	Reserved
RW-0	RW-0	RW-0	RW-0	RW-0	RW-0		

R = read, W = write, 0 = value after reset

program counter (PC)

The contents of the PC point to the memory location of the next instruction to be executed. The PC consists of two 8-bit registers in the CPU: the program counter high (PCH) and program counter low (PCL). These registers contain the most significant byte (MSbyte) and least significant byte (LSbyte) of a 16-bit address.

The contents of the reset vector (7FFEh, 7FFFh) are loaded into the program counter during reset. The PCH (MSbyte of the PC) is loaded with the contents of memory location 7FFEh, and the PCL (LSbyte of the PC) is loaded with the contents of memory location 7FFFh. Figure 2 shows this operation using an example value of 6000h as the contents of memory locations 7FFEh and 7FFFh (reset vector).

SPNS016C - NOVEMBER 1992 - REVISED FEBRUARY 1997

program counter (PC) (continued)

Figure 2. Program Counter After Reset

memory map

The TMS370Cx4x family architecture is based on the Von Neumann architecture, where the program memory and data memory share a common address space. All peripheral input/output is memory mapped in this same common address space. As shown in Figure 3, the TMS370Cx4x family provides memory-mapped RAM, ROM, data EEPROM, EPROM, input/output pins, peripheral functions, and system interrupt vectors.

The peripheral file contains all input/output port control, peripheral status and control, EPROM and EEPROM memory programming, and system-wide control functions. The peripheral file is located between 1010h and 107Fh and is logically divided into seven peripheral file frames of 16 bytes each. Each on-chip peripheral is assigned to a separate frame through which peripheral control and data information is passed.

SPNS016C - NOVEMBER 1992 - REVISED FEBRUARY 1997

memory map (continued)

Figure 3. TMS370Cx4x Memory Map

RAM/register file (RF)

Locations within the RAM address space can serve as the RF, general-purpose read/write memory, program memory, or the stack instructions. The TMS370Cx4x devices contain 256 bytes of internal RAM memory mapped beginning at location 0000h (R0) and continuing through location 00FFh (R255).

The first two registers, R0 and R1, are also called register A and B, respectively. Some instructions implicitly use register A or B; for example, the instruction LDSP (load SP) assumes that the value to be loaded into the stack pointer is contained in register B. Registers A and B are the only registers cleared on reset.

peripheral file (PF)

The TMS370Cx4x control registers contain all the registers necessary to operate the system and peripheral modules on the device. The instruction set includes some instructions that access the PF directly. These instructions designate the register by the number of the PF relative to 1000h, preceded by P0 for a hexadecimal designator or P for a decimal designator. For example, the system control register 0 (SCCR0) is located at address 1010h; its peripheral file hexadecimal designator is P010, and its decimal designator is P16. Table 4 shows the TMS370Cx4x PF address map.

SPNS016C - NOVEMBER 1992 - REVISED FEBRUARY 1997

peripheral file (PF) (continued)

ADDRESS RANGE	PERIPHERAL FILE DESIGNATOR	DESCRIPTION
1000h-100Fh	P000-P00F	Reserved for factory test
1010h-101Fh	P010-P01F	System and EPROM/EEPROM control registers
1020h-102Fh	P020-P02F	Digital I/O port control registers
1030h-103Fh	P030-P03F	Reserved

1080h-10FFh	P080-P0FF	Reserved

Table 4. TMS370Cx4x Peripheral File Address Map

data EEPROM

The TMS370Cx4x devices, containing 256 bytes of data EEPROM, have memory mapped beginning at location 1F00h and continuing through location 1FFFh. Writing to the data EEPROM module is controlled by the data EEPROM control register (DEECTL) and the write-protection register (WPR). Programming algorithm examples are available in the *TMS370 Family User's Guide* (literature number SPNU127) or the *TMS370 Family Data Manual* (literature number SPNS014B). The data EEPROM features include the following:

- Programming:
 - Bit-, byte-, and block-write/erase modes
 - Internal charge pump circuitry. No external EEPROM programming voltage supply is needed.
 - Control register: Data EEPROM programming is controlled by the DEECTL located in the PF frame beginning at location P01A (see Table 5).
 - In-circuit programming capability. There is no need to remove the device to program it.
- Write protection. Writes to the data EEPROM are disabled during the following conditions.
 - Reset. All programming of the data EEPROM module is halted.
 - Write protection active. There is one write-protect bit per 32-byte EEPROM block.
 - Low-power mode operation
- Write protection can be overridden by applying 12 V to MC.

Table 5. Data EEPROM and PROGRAM EPROM Control Register Memory Map

ADDRESS	SYMBOL	NAME
P01A	DEECTL	DATA EEPROM Control Register
P01B	-	Reserved
P01C	EPCTL	Program EPROM Control Register

program EPROM

The TMS370C742A device contains 8K bytes of EPROM mapped, beginning at location 6000h and continuing through location 7FFFh. Memory addresses 7FE0h through 7FEBh are reserved for Texas Instruments (TI[™]), and memory addresses 7FECh through 7FFFh are reserved for interrupt and reset vectors. Trap vectors, used with TRAP0 through TRAP15 instructions, are located between addresses 7FC0h and 7FDFh. Reading the program EPROM modules is identical to reading other internal memory. During programming, the EPROM is controlled by the EPROM control register (EPCTL). The program EPROM module features include:

- Programming
 - In-circuit programming capability if VPP is applied to MC
 - Control register: EPROM programming is controlled by the EPROM control register (EPCTL) located in the peripheral file (PF) frame at location P01C as shown in Table 5.
- Write protection: writes to the program EPROM are disabled under the following conditions:
 - Reset: All programming to the EPROM module is halted.
 - Low-power modes
 - 13 V not applied to MC

program ROM

The program ROM consists of 4K or 8K bytes of mask-programmable read-only memory. The program ROM is used for permanent storage of data or instructions. Memory addresses 7FE0h through 7FEBh are reserved for TI, and memory addresses 7FECh through 7FFFh are reserved for interrupt and reset vectors. Trap vectors, used with TRAP0 through TRAP15 instructions, are located between addresses 7FC0h and 7FDFh. Programming of the mask ROM is performed at the time of device fabrication.

system reset

The system-reset operation ensures an orderly start-up sequence for the TMS370Cx4x CPU-based device. There are up to three different actions that can cause a system reset to the device. Two of these actions are generated internally, while one (RESET pin) is controlled externally. These actions are as follows:

- Watchdog (WD) timer. A watchdog-generated reset occurs if an improper value is written to the WD key register, or if the re-initialization does not occur before the watchdog timer timeout. See the *TMS370 Family User's Guide* (literature number SPNU127) for more information.
- Oscillator reset. Reset occurs when the oscillator operates outside of the recommended operating range. See the TMS370 Family User's Guide (literature number SPNU127) for more information.
- External RESET pin. A low level signal can trigger an external reset. To ensure a reset, the external signal should be held low for one SYSCLK cycle. Signals of less than one SYSCLK can generate a reset. See the *TMS370 Family User's Guide* (literature number SPNU127) for more information.

Once a reset source is activated, the external $\overrightarrow{\text{RESET}}$ pin is driven (active) low for a minimum of eight SYSCLK cycles. This allows the 'x4x device to reset external system components. Additionally, if a cold start (V_{CC} is off for several hundred milliseconds) condition or oscillator failure occurs or the $\overrightarrow{\text{RESET}}$ pin is held low, then the reset logic holds the device in a reset state for as long as these actions are active.

After a reset, the program can check the oscillator-fault flag (OSC FLT FLAG, SCCR0.4), the cold-start flag (COLD START, SCCR0.7) and the watchdog reset (WD OVRFL INT FLAG, T1CTL2.5) to determine the source of the reset. A reset does not clear these flags. Table 6 lists the reset sources.

TI is a trademark of Texas Instruments Incorporated.

SPNS016C - NOVEMBER 1992 - REVISED FEBRUARY 1997

system reset (continued)

REGISTER	ADDRESS	PF	BIT NO.	CONTROL BIT	SOURCE OF RESET
SCCR0	1010h	P010	7	COLD START	Cold (power-up)
SCCR0	1010h	P010	4	OSC FLT FLAG	Oscillator out of range
T1CTL2	104Ah	P04A	5	WD OVRFL INT FLAG	Watchdog timer timeout

Table 6. Reset Sources

Once a reset is activated, the following sequence of events occurs:

1. The CPU registers are initialized: ST = 00h, SP = 01h (reset state).

2. Registers A and B are initialized to 00h (no other RAM is changed).

3. The contents of the LSbyte of the reset vector (07FFh) are read and stored in the PCL.

- 4. The contents of the MSbyte of the reset vector (07FEh) are read and stored in the PCH.
- 5. Program execution begins with an opcode fetch from the address pointed to the PC.

The reset sequence takes 20 SYSCLK cycles from the time the reset pulse is released until the first opcode fetch. During a reset, RAM contents (except for registers A and B) remain unchanged, and the module control register bits are initialized to their reset state.

SPNS016C - NOVEMBER 1992 - REVISED FEBRUARY 1997

interrupts

The TMS370 family software-programmable interrupt structure supports flexible on-chip and external interrupt configurations to meet real-time interrupt-driven application requirements. The hardware interrupt structure incorporates two priority levels as shown in Figure 4. Interrupt level 1 has a higher priority than interrupt level 2. The two priority levels can be independently enabled by the global-interrupt enable bits (IE1 and IE2) of the status register.

Figure 4. Interrupt Control

Each system interrupt is configured independently on either the high- or low-priority chain by the application program during system initialization. Within each interrupt chain, the interrupt priority is fixed by the position of the system interrupt. However, since each system interrupt is configured selectively on either the high- or low-priority interrupt chain, the application program can elevate any system interrupt to the highest priority. Arbitration between the two priority levels is performed within the CPU. Arbitration within each of the priority

SPNS016C - NOVEMBER 1992 - REVISED FEBRUARY 1997

interrupts (continued)

chains is performed within the peripheral modules to support interrupt expansion to future modules. Pending interrupts are serviced upon completion of current instruction execution, depending on their interrupt mask and priority conditions.

The TMS370Cx4x has eight hardware system interrupts (plus RESET) as shown in Table 7. Each system interrupt has a dedicated interrupt vector located in program memory through which control is passed to the interrupt service routines. A system interrupt can have multiple interrupt sources (e.g., SCI RXNT has two interrupt sources). All of the interrupt sources are individually maskable by local interrupt-enable control bits in the associated peripheral file. Each interrupt source FLAG bit is individually readable for software polling or for determining which interrupt source generated the associated system interrupt.

Five of the system interrupts are generated by on-chip peripheral functions, and three external interrupts are supported. Software configuration of the external interrupts is performed through the INT1, INT2, and INT3 control registers in peripheral file frame 1. Each external interrupt is individually software-configurable for input polarity (rising or falling) for ease of system interface. External interrupt INT1 is software-configurable as either a maskable or non-maskable interrupt. When INT1 is configured as non-maskable, it cannot be masked by the individual- or global-enable mask bits. The INT1 NMI bit is protected during non-privileged operation and, therefore, should be configured during the initialization sequence following reset. To maximize pin flexibility, external interrupts INT2 and INT3 can be software-configured as general-purpose input/output pins if the interrupt function is not required (INT1 can be configured similarly as an input pin).

INTERRUPT SOURCE	INTERRUPT FLAG	SYSTEM INTERRUPT	VECTOR ADDRESS	PRIORITY

privileged operation and EEPROM write-protection override

The TMS370Cx4x family has significant flexibility to enable the designer to software-configure the system and peripherals to meet the requirements of a broad variety of applications. The nonprivileged mode of operation ensures the integrity of the system configuration, once defined for an end application. Following a hardware reset, the TMS370Cx4x operates in the privileged mode, where all peripheral file registers have unrestricted read/write access and the application program configures the system during the initialization sequence following reset. As the last step of system initialization, the PRIVILEGE DISABLE bit (SCCR2.0) is set to 1, entering the nonprivileged mode and disabling write operations to specific configuration control bits within the peripheral file. The system-configuration bits listed in Table 8 are write-protected during the nonprivileged mode and must be configured by software prior to exiting the privileged mode.

Table 8. Privilege Bits

[†] The privileged bits are shown in a bold typeface in the peripheral file frames of the following sections.

The WPO mode provides an external hardware method for overriding the write protection registers (WPR) of data EEPROM on the TMS370Cx4x. Applying a 12-V input to the MC pin after the RESET pin input goes high causes the device to enter WPO mode. The high voltage on the MC pin during the WPO mode is not the programming voltage for the data EEPROM or program EPROM. All EEPROM programming voltages are generated on-chip. The WPO mode provides hardware system level capability to modify the content of data EEPROM while the device remains in the application but only while requiring a 12-V external input on the MC pin (normally not available in the end application except in a service or diagnostic environment).

low-power and IDLE modes

The TMS370Cx4x devices have two low-power modes (STANDBY and HALT) and an IDLE mode. For mask-ROM devices, low-power modes can be disabled permanently through a programmable contact at the time the mask is manufactured.

SPNS016C - NOVEMBER 1992 - REVISED FEBRUARY 1997

low-power and IDLE modes (continued)

The STANDBY and HALT low-power modes significantly reduce power consumption by reducing or stopping the activity of the various on-chip peripherals when processing is not required. Each of the low-power modes is entered by executing the IDLE instruction when the PWRDWN/IDLE bit in SCCR2 has been set to 1. The HALT/STANDBY bit in SCCR2 controls which low-power mode is entered.

In the STANDBY mode (HALT/STANDBY = 0), all CPU activity and most peripheral module activity is stopped; however, the oscillator, internal clocks, Timer 1, and the receive start-bit-detection circuit of the SCI1 remain active. System processing is suspended until a qualified interrupt (hardware RESET, external interrupt on INT1, INT2, INT3, Timer 1 interrupt, or a low level on the receive pin of the serial communications interface 1) is detected.

In the HALT mode (HALT/STANDBY=1), the TMS370Cx4x is placed in its lowest power-consumption mode. The oscillator and internal clocks are stopped, causing all internal activity to be halted. System activity is suspended until a qualified interrupt (hardware RESET external interrupt on INT1, INT2, INT3, or low level on the receive pin of the SCI1) is detected. The power-down mode selection bits are sumarized in Table 9.

POWER-DOWN	CONTROL BITS	
PWRDWN/IDLE (SCCR2.6)	HALT/STANDBY (SCCR2.7)	MODE SELECTED
1	0	STANDBY
1	1	HALT
0	Х	IDLE
V den't core		

Table 9. Low-Power/Idle Control Bits

X = don't care

When low-power modes are disabled through a programmable contact in the mask-ROM devices, writing to the SCCR2.6–7 bits is ignored. In addition, if an idle instruction is executed when low-power modes are disabled through a programmable contact, the device always enters the IDLE mode.

To provide a method of always exiting low-power modes for mask-ROM devices, INT1 is automatically enabled as a nonmaskable interrupt (NMI) during low-power modes when the hard watchdog mode is selected. This means that the NMI is always generated, regardless of the interrupt enable flags.

The following information is preserved throughout both the STANDBY and HALT modes: RAM (register file), CPU registers (stack pointer, program counter, and status register), I/O pin direction and output data, and status registers of all on-chip peripheral functions. Since all CPU-instruction processing is stopped during the STANDBY and HALT modes, the clocking of the WD timer is inhibited.

clock modules

The 'x4x family provides two clock options that are referred to as divide-by-1 (phase-locked loop) and divide-by-4 (standard oscillator). Both the divide-by-1 and divide-by-4 options are configurable during the manufacturing process of a TMS370 microcontroller. The 'x4x ROM-masked devices offer both options to meet system engineering requirements. Only one of the two clock options is allowed on each ROM device. The '742A EPROM has only the divide-by-4.

The divide-by-1 clock module option provides the capability for reduced electromagnetic interference (EMI) with no added cost.

The divide-by-1 clock module option provides a one-to-one match of the external resonator frequency (CLKIN) to the internal system clock (SYSCLK) frequency. The divide-by-4 option produces a SYSCLK which is one-fourth of the frequency of the external resonator. Inside of the divide-by-1 module, the frequency of the external resonator is multiplied by four, and the clock module then divides the resulting signal by four to provide the four-phased internal system clock signals. The resulting SYSCLK is equal to the resonator frequency.

SPNS016C - NOVEMBER 1992 - REVISED FEBRUARY 1997

clock modules (continued)

These are formulated as follows:

Divide-by-4 : SYSCLK =
$$\frac{\text{external resonator frequency}}{4} = \frac{\text{CLKIN}}{4}$$

Divide-by-1 : SYSCLK = $\frac{\text{external resonator frequency} \times 4}{4} = \text{CLKIN}$

The main advantage of choosing a divide-by-1 oscillator is the reduction of EMI. The harmonics of low-speed resonators extend through less of the emissions spectrum than the harmonics of faster resonators. The divide-by-1 option provides the capability of reducing the resonator speed by four times, resulting in a steeper decay of emissions produced by the oscillator.

system configuration registers

Table 10 contains system configuration and control functions and registers for controlling EEPROM programming. The privileged bits are shown in a bold typeface.

SPNS016C - NOVEMBER 1992 - REVISED FEBRUARY 1997

timer 1 module

The programmable Timer 1 (T1) module of the TMS370Cx4x provides the designer with the enhanced timer resources required to perform real-time system control. The T1 module contains the general-purpose timer and the watchdog (WD) timer. The two independent 16-bit timers, T1 and WD, allow program selection of input clock sources (real-time, external event, or pulse accumulate) with multiple 16-bit registers (input capture and compare) for special timer function control. The T1 module includes three external device pins that can be used for multiple counter functions (operation-mode dependent), or used as general-purpose I/O pins. The T1 module block diagram is shown in Figure 5.

Figure 5. Timer 1 Block Diagram

- Three T1 I/O pins
 - T1IC/CR: T1 input capture / counter-reset input pin, or general-purpose bidirectional I/O pin
 - T1PWM: T1 pulse-width-modulation (PWM) output pin, or general-purpose bidirectional I/O pin
 - T1EVT: T1 event input pin, or general-purpose bidirectional I/O pin
- Two operational modes:
 - Dual-compare mode: Provides PWM signal
 - Capture/compare mode: Provides input capture pin
- One 16-bit general-purpose resettable counter
- One 16-bit compare register with associated compare logic
- One 16-bit capture/compare register, which, depending on the mode of operation, operates as either a capture or compare register.
- One 16-bit WD counter can be used as an event counter, a pulse accumulator, or an interval timer if WD feature is not needed.
- Prescaler/clock sources that determine one of eight clock sources for general-purpose timer

SPNS016C - NOVEMBER 1992 - REVISED FEBRUARY 1997

timer 1 module (continued)

- Selectable edge-detection circuitry that, depending on the mode of operation, senses active transitions on the input capture pins (T1IC/CR)
- Interrupts that can be generated on the occurrence of:
 - A capture
 - A compare equal
 - A counter overflow
 - An external edge detection
- Sixteen T1 module control registers located in the PF frame, beginning at address P040

The T1 module control registers are illustrated in Table 13.

SPNS016C - NOVEMBER 1992 - REVISED FEBRUARY 1997

timer 1 module (continued)

Figure 7 shows the T1 capture/compare mode block diagram. The annotations on the diagram identify the register and the bits in the peripheral frame. For example, the actual address of T1CTL2.0 is 104Ah, bit 0, in the T1CTL2 register.

Figure 7. Timer 1: Capture/Compare Mode

SPNS016C - NOVEMBER 1992 - REVISED FEBRUARY 1997

timer 1 module (continued)

The TMS370Cx4x device includes a 24-bit WD timer, contained in the T1 module, which can be programmed as an event counter, pulse accumulator, or interval timer if the WD function is not used. The WD function is to monitor software and hardware operation and to implement a system reset when the WD counter is not properly serviced (WD counter overflow or WD counter is re-initialized by an incorrect value). The WD can be configured as one of three mask options as follows:

- Standard WD configuration (see Figure 8) for 'C742A EPROM and mask-ROM devices:
 - Watchdog mode
 - Ten different WD overflow rates ranging from 6.55 ms to 3.35 s at 5-MHz SYSCLK
 - A WD reset key (WDRST) register is used to clear the watchdog counter (WDCNTR) when a correct value is written
 - Generates a system reset if an incorrect value is written to the WD reset key or if the counter overflows
 - A WD overflow flag (WD OVRFL INT FLAG) bit that indicates whether the WD timer initiated a system reset
 - Non-watchdog mode
 - Watchdog timer can be configured as an event counter, pulse accumulator, or an interval timer

SPNS016C - NOVEMBER 1992 - REVISED FEBRUARY 1997

timer 1 module (continued)

- Hard watchdog configuration (see Figure 9) for mask-ROM devices only:
 - Eight different WD overflow rates ranging from 26.2 ms to 3.35 s at 5-MHz SYSCLK
 - A WD reset key (WDRST) register is used to clear the watchdog counter (WDCNTR) when a correct value is written.
 - Generates a system reset if an incorrect value is written to the WDRST or if the counter overflows
 - A WD overflow flag (WD OVRFL INT FLAG) bit that indicates whether the WD timer initiated a system
 reset
 - Automatic activation of the WD timer upon power-up reset
 - INT1 is enabled as a nonmaskable interrupt during low power modes.

Figure 9. Hard Watchdog

SPNS016C - NOVEMBER 1992 - REVISED FEBRUARY 1997

timer 1 module (continued)

- Simple counter configuration (see Figure 10) for mask-ROM devices only
 - Simple counter can be configured as an event counter, pulse accumulator, or an internal timer.

Figure 10. Simple Counter

SPNS016C - NOVEMBER 1992 - REVISED FEBRUARY 1997

timer 2A module

The 16-bit general-purpose timer 2A (T2A) module is composed of a 16-bit resettable counter, 16-bit compare register with associated compare logic, 16-bit capture register, and a 16-bit register that functions as a capture register in one mode and as a compare register in the other mode. The T2A module adds an additional timer that provides an event count, input capture, and compare function. The T2A module includes three external device pins that can be dedicated as timer functions or used as general-purpose I/O pins. The T2A module is shown in Figure 11.

Figure 11. Timer 2A Module Block Diagram

The T2A module features include the following:

- Three T2A I/O pins:
 - T2AIC1/CR: T2A input-capture 1/counter-reset input pin, or general-purpose bidirectional I/O pin
 - T2AIC2/PWM: T2A input-capture 2/pulse-width-modulation (PWM) output pin, or general-purpose bidirectional I/O pin
 - T2AEVT: Timer 2A event-input pin, or general-purpose bidirectional I/O pin
- Two operational modes:
 - Dual-compare mode: Provides PWM signal
 - Dual-capture mode: Provides input-capture pin
- One 16-bit general-purpose resettable counter
- One 16-bit compare register with associated compare logic
- One 16-bit capture register with associated capture logic
- One 16-bit capture/compare register, which, depending on the mode of operation, operates as either a capture or compare register

SPNS016C - NOVEMBER 1992 - REVISED FEBRUARY 1997

timer 2A module (continued)

- T2A clock sources can be any of the following:
 - System clock
 - No clock (the counter is stopped)
 - External clock synchronized to the system clock (event counter)
 - System clock while external input is high (pulse accumulation)
- Selectable edge-detection circuitry that, depending on the mode of operation, senses active transitions on the input capture pins (T2AIC1/CR)
- Interrupts that can be generated on the occurrence of:
 - A compare equal to dedicated-compare register
 - A compare equal to capture-compare register
 - A counter overflow
 - An external edge 1 detection
 - An external edge 2 detection
- Fourteen T2A module-control registers: Located in the PF frame beginning at address P060

SPNS016C - NOVEMBER 1992 - REVISED FEBRUARY 1997

timer 2A module (continued)

The T2A module-control registers are shown in Table 14.

SPNS016C - NOVEMBER 1992 - REVISED FEBRUARY 1997

serial communications interface 1 (SCI1)

The TMS370Cx4x devices include a serial communications interface 1 (SCI1) module. The SCI1 module supports digital communications between the TMS370 devices and other asynchronous peripherals and uses the standard non return-to-zero format (NRZ) format. The SCI1's receiver and transmitter are double buffered, and each has its own separate enable and interrupt bits. Both can be operated independently or simultaneously in the full duplex mode. To ensure data integrity, the SCI1 checks received data for break detection, parity, overrun, and framing errors. The bit rate (baud) is programmable to over 65,000 different rates through a 16-bit baud-select register.

Features of the SCI1 module include:

- Three external pins:
 - SCITXD: SCI transmit-output pin or general purpose bidirectional I/O pin.
 - SCIRXD: SCI receive-input pin or general purpose bidirectional I/O pin.
 - SCICLK: SCI bidirectional serial-clock pin, or general-purpose bidirectional I/O pin.
- Two communications modes: asynchronous and isosynchronous
- Baud rate: 64K different programmable rates
 - Asynchronous mode: 3 bps to 156K bps at 5 MHz SYSCLK

Asynchronous Baud =
$$\frac{SYSCLK}{(BAUD REG + 1) \times 32}$$

Isosynchronous mode: 39 bps to 2.5 Mbps at 5 MHz SYSCLK

Isosynchronous Baud =
$$\frac{\text{SYSCLK}}{(\text{BAUD REG} + 1) \times 2}$$

- Data word format:
 - One start bit
 - Data word length programmable from one to eight bits
 - Optional even/odd/no parity bit
 - One or two stop bits
- Four error-detection flags: parity, overrun, framing, and break detection
- Two wake-up multiprocessor modes: Idle-line and address bit
- Half or full-duplex operation
- Double-buffered receiver and transmitter operations
- Transmitter and receiver operations can be accomplished through either interrupt-driven or polled-algorithms with status flags:
 - Transmitter: TXRDY flag (transmitter buffer register is ready to receive another character) and TX EMPTY flag (Transmitter shift register is empty)
 - Receiver: RXRDY flag (receive buffer register ready to receive another character), BRKDT flag (break condition occurred), and RX ERROR monitoring four interrupt conditions
 - Separate enable bits for transmitter and receiver interrupts
 - NRZ (non return-to-zero) format
- Eleven SCI1 module control registers, located in control register frame beginning at address P050h

SPNS016C - NOVEMBER 1992 - REVISED FEBRUARY 1997

serial communications interface 1 (SCI1) (continued)

analog-to-digital converter 1 (ADC1) module

The analog-to-digital converter 1 (ADC1) module is an 8-bit, successive approximation converter with internal sample-and-hold circuitry. The module has eight multiplexed analog input channels for the 44-pin device and four multiplexed analog input channels for the 40-pin device that allow the processor to convert the voltage levels from up to eight different sources. The ADC1 module features include the following:

- Minimum conversion time: 32.8 μs at 5-MHz SYSCLK
- Up to ten external pins:
 - Four (AN2, AN3, AN6, AN7) or eight (AN0-AN7) analog input channels, any of which can be software configured as digital inputs (E2, E3, E6, E7) or (E0-E7), respectively, if not needed as analog channels
 - AN1-AN7 can also be configured as positive-input voltage reference.
 - V_{CC3}: ADC1 module high-voltage reference input
 - V_{SS3}: ADC1 module low-voltage reference input
- The ADDATA register, which contains the digital result of the last A/D conversion
- A/D operations can be accomplished through either interrupt driven or polled algorithms.
- Six ADC1 module control registers are located in the control-register frame beginning at address 1070h.

The ADC1 module control registers are illustrated in Table 16.

instruction set overview

Table 17 provides an opcode-to-instruction cross-reference of all 73 instructions and 274 opcodes of the '370Cx4x instruction set. The numbers at the top of this table represent the most significant nibble (MSN) of the opcode while the numbers at the left side of the table represent the least significant nibble (LSN). The instructions for these two opcode nibbles contain the mnemonic, operands, and byte/cycle particular to that opcode.

For example, the opcode B5h points to the CLR A instruction. This instruction contains one byte and executes in eight SYSCLK cycles.

SPNS016C - NOVEMBER 1992 - REVISED FEBRUARY 1997

development system support

The TMS370 family development support tools include an assembler, a C compiler, a linker, an in-circuit emulator (XDS/22), compact development tool (CDT) and an EEPROM/UVEPROM programmer.

- Assembler/linker (Part No. TMDS3740850-02 for PC)
 - Includes extensive macro capability
 - Provides high-speed operation
 - Offers format conversion utilities available for popular formats
- ANSI C compiler (Part No. TMDS3740855-02 for PC, Part No. TMDS3740555-09 for HP700[™], Sun-3[™] or Sun-4[™])
 - Generates assembly code of the TMS370 that can be inspected easily
 - Improves code execution speed and reduces code size with optional optimizer pass
 - Enables the user to directly reference the TMS370's port registers by using a naming convention
 - Provides flexibility in specifying the storage for data objects
 - Interfaces C functions and assembly functions easily
 - Includes assembler and linker
- CDT370 (compact development tool) real-time in-circuit emulation
 - Base (Part Number EDSCDT370 for PC, requires cable)
 - Cable for 44-pin PLCC (Part No. EDSTRG44PLCC)
 - Cable for 40-pin DIP (Part No. EDSTRG40DIL)
 - Cable for 40-pin SDIP (Part No. EDSTRG40SDIL)
 - Provides EEPROM and EPROM programming support
 - Allows inspection and modification of memory locations
 - Allows uploading and downloading of program and data memory
 - Provides capability to execute programs and software routines
 - Includes 1024-sample trace buffer
 - Includes single-step executable instructions
 - Allows uses of software breakpoints to halt program execution at selected address
- XDS/22 (extended development support) in-circuit emulator
 - Base (Part No. TMDS3762210 For PC, requires cable)
 - Cable for 44-pin PLCC, 40-pin DIP, or shrink DIP (Part No. TMDS3788844)
 - Contains all the features of the CDT370 described above but does not have the capability to program the data EEPROM and program EPROM
 - Contains sophisticated breakpoint trace and timing hardware that provides up to 2047 qualified trace samples with symbolic disassembly
 - Allows breakpoints to be qualified by address and/or data on any type of memory acquisition. Up to four levels of events can be combined to cause a breakpoint.

HP700 is a trademark of Hewlett-Packard Company. Sun-3 and Sun-4 are trademarks of Sun Microsystems, Inc.

SPNS016C - NOVEMBER 1992 - REVISED FEBRUARY 1997

development system support (continued)

- Provides timers for analyzing total and average time in routines
- Contains an eight-line logic probe for adding external signal visibility to the breakpoint qualifier and to the trace display
- Microcontroller programmer
 - Base (Part No. TMDS3760500A For PC, requires programming head)
 - Single unit head for 44-pin PLCC (Part No. TMDS3780510A)
 - Single unit head for 40-pin DIP or shrink DIP (Part No. TMDS3780511A)
 - PC-based, window/function-key oriented user interface for ease of use and a rapid learning environment
- Starter kit (Part No. TMDS37000 For PC)
 - Includes TMS370 Assembler diskette and documentation
 - Includes TMS370 Simulator
 - Includes programming adapter board and programming software
 - Does not include (to be supplied by the user):
 - + 5 V power supply ZIF sockets
 9-pin RS-232 cable

SPNS016C - NOVEMBER 1992 - REVISED FEBRUARY 1997

device numbering conventions

Figure 16 illustrates the numbering and symbol nomenclature for the TMS370Cx4x family.

Prefix:	TMS	=	Standard prefix for fully qualified devices
	SE	=	System evaluator (window EPROM) that is used for prototyping purpose.
Family:	370	=	TMS370 8-Bit Microcontroller Family
Technology:	С	=	CMOS
Program Memory Types:	0	=	Mask ROM
	3 7	=	Mask ROM, No Data EEPROM EPROM
Device Type:	4	=	x4x devices containing the following modules:
			- Timer 1
			- Timer ZA - Serial Communications Interface 1
			- Analog-to-Digital Converter 1
Memory Size:	0	=	4K bytes
	2	=	8K bytes
Temperature Ranges:	Α	=	-40°C to 85°C
	L	=	0°C to 70°C
Destaura		=	
Packages:	FN F7	-	Plastic Leaded Chip Carrier
	JC	_	Ceramic Shrink Dual-In-Line
	JD	=	Ceramic Dual-In-Line
	Ν	=	Plastic Dual-In-Line
	NJ	=	Plastic Shrink Dual-In-Line
—— ROM and EPROM Option:	Α	=	For ROM device, the watchdog timer can be configured as one of the three different mask options:
			- A hard watchdog
			- A simple watchdog
			The clock can be either:
			- Divide-by-4 clock
			- Divide-by-1 (PLL) clock
			I ne low-power modes can be either:
			- Disabled
	Α	=	For EPROM device, a standard watchdog, a divide-by-4
			clock, and low-power modes are enabled

Figure 16. TMS370Cx4x Family Nomenclature

SPNS016C - NOVEMBER 1992 - REVISED FEBRUARY 1997

device part numbers

Table 18 lists all the 'x4x devices available at present. The device part-number nomenclature is designed to assist ordering. Upon ordering, the customer must specify not only the device part number, but also the clock and watchdog timer options desired. Each device can have only one of the possible three watchdog timer options and one of the two clock options. The options to be specified pertain solely to orders involving ROM devices.

	Supply current (HALT mode)		XTALK2/CLKIN < 0.2 V (see Note 4)		2	30	μΑ

NOTES: 3. Microcontroller-single chip mode, ports configured as inputs, or outputs with no load. All inputs \leq 0.2 V or \geq V_{CC} -0.2 V.

4. XTAL2/CLKIN is driven with an external square wave signal with 50% duty cycle and rise and fall times less than 10 ns. Current can be higher with a crystal oscillator. At 5-MHz SYSCLK this extra current = 0.01 mA × (total load capacitance + crystal capacitance in pF).

5. Maximum operating current = 7.6 (SYSCLK) + 7 mA.

6. Maximum standby current =3 (SYSCLK) + 2 mA. (Osc power bit = 0.)

7. Maximum standby current = 2.24 (SYSCLK) + 1.9 mA. (Osc power bit = 1 and valid up to 3-MHz SYSCLK.)

8. Input current I_{PP} is a maximum of 50 mA only when EPROM is being programmed.

SPNS016C - NOVEMBER 1992 - REVISED FEBRUARY 1997

RECOMMENDED CRYSTAL/CLOCK CONNECTIONS

[†] The values of C1 and C2 are typically 15 pF and C3 value is typically 50 pF. See the manufacturer's recommendations for ceramic resonators. [‡] The crystal/ceramic resonator frequency is four times the reciprocal of the system clock period.

TYPICAL OUTPUT LOAD CIRCUIT§

§ All measurements are made with the pin loading as shown unless otherwise noted. All measurements are made with XTAL2/CLKIN driven by an external square wave signal with a 50% duty cycle and rise and fall times less than 10 ns unless otherwise stated.

TYPICAL INPUT BUFFERS

SPNS016C - NOVEMBER 1992 - REVISED FEBRUARY 1997

PARAMETER MEASUREMENT INFORMATION

timing parameter symbology

Timing parameter symbols have been created in accordance with JEDEC Standard 100. In order to shorten the symbols, some of the pin names and other related terminology have been abbreviated as follows:

А	Address	R	Read
AR	Array	RXD	SCIRXD
В	Byte	SC	SYSCLK
CI	XTAL2/CLKIN	SCC	SCICLK
D	Data	TXD	SCITXD
PGM	Program	W	Write
Lowerca	ase subscripts and their meanings are:		
с	cycle time (period)	r	rise time
d	delay time	su	setup time
f	fall time	V	valid time
h	hold time	W	pulse duration (width)
The foll	owing additional letters are used with these	e meanings:	
Н	High	V	Valid
L	Low	Z	High Impedance

All timings are measured between high and low measurement points as indicated in the figures below.

0.8 V_{CC} V (High) 0.8 V (Low)

XTAL2/CLKIN Measurement Points

2 V (High) 0.8 V (Low)

General Measurement Points

Figure 22. SCI1 Isosynchronous Mode Timing Diagram for External Clock

SPNS016C - NOVEMBER 1992 - REVISED FEBRUARY 1997

ADC1

The ADC1 has a separate power bus for its analog circuitry. These pins are referred to as V_{CC3} and V_{SS3} . Their purpose is to enhance ADC1 performance by preventing digital switching noise on the logic circuitry that could be present on V_{SS} and V_{CC} from coupling into the ADC1 analog stage. All ADC1 specifications are given with respect to V_{SS3} unless otherwise noted.

Resolution	
Monotonic	Yes
Output conversion code	. 00h to FFh (00h for $V_{I} \leq V_{SS3}$; FFh for $V_{I} \geq V_{ref}$)
Conversion time (excluding sample time)	

recommended operating conditions

		MIN	NOM	MAX	UNIT	
V	Analog supply voltage		5	5.5	v	
V _{CC3}				V _{CC} + 0.3		
V_{SS3}	Analog ground	V _{SS} - 0.3		V _{SS} + 0.3	V	
V _{ref}	Non-V _{CC3} reference [†]	2.5	V_{CC3}	V _{CC3} + 0.1	V	
	Analog input for conversion	V _{SS3}		V _{ref}	V	

[†] V_{ref} must be stable, within ± 1/2 LSB of the required resolution, during the entire conversion time.

operating characteristics over ranges of recommended operating conditions

	PARAMETER	TEST CONDITIONS	MIN	MAX	UNIT
	Absolute accuracy (see Note 12)	V_{CC3} = 5.5 V, V_{ref} = 5.1 V		+1.5	LSB
	Differential/integral linearity error (see Notes 12 and 13)	V_{CC3} = 5.5 V, V_{ref} = 5.1 V		±0.9	LSB
	A salar a salar sural	Converting		2	mA
I _{CC3}	Analog supply current	Nonconverting		5	μA
lj –	Input current, AN0-AN7	$0 \text{ V} \leq \text{V}_{\text{I}} \leq 5.5 \text{ V}$		2	μA
	V _{ref} input charge current			1	mA
Z _{ref}		SYSCLK ≤ 3 MHz		24	kΩ
	Source impedance v _{ref}	3 MHz < SYSCLK ≤ 5 MHz		10	kΩ

NOTES: 12. Absolute resolution = 20 mV. At V_{ref} = 5 V, this is 1 LSB. As V_{ref} decreases, LSB size decreases and thus absolute accuracy and differential / integral linearity errors in terms of LSBs increases.

13. Excluding quantization error of 1/2 LSB.

SPNS016C - NOVEMBER 1992 - REVISED FEBRUARY 1997

ADC1 (continued)

The ADC1 module allows complete freedom in design of the sources for the analog inputs. The period of the sample time is user-defined such that high-impedance sources can be accommodated without penalty to low-impedance sources. The sample period begins when the SAMPLE START bit of the ADC1 control register (ADCTL) is set to 1. The end of the signal sample period occurs when the conversion bit (CONVERT START) of the ADCTL is set to 1. After a hold time, the converter resets the SAMPLE START and CONVERT START bits, signaling that a conversion has started and the analog signal can be removed.

analog timing requirements

		MIN	MAX	UNIT
t _{su(S)}	Setup time, analog input to sample command	0		ns
t _{h(AN)}	Hold time, analog input from start of conversion	18t _c		ns
t _{w(S)}	Pulse duration, sample time per kilohm of source impedance (see Note 14)	1		μs/kΩ

NOTE 14: The value given is valid for a signal with a source impedance > 1 k Ω . If the source impedance is < 1 k Ω , use a minimum sampling time of 1 μ s.

Figure 23. Analog Timing

SPNS016C - NOVEMBER 1992 - REVISED FEBRUARY 1997

Table 20 is designed to aid the user in referencing a device part number to a mechanical drawing. The table shows a cross-reference of the device part number to the TMS370 generic package name and the associated mechanical drawing by drawing number and name.

PKG TYPE (mil pin spacing)	TMS370 GENERIC NAME	PKG TYPE NO. AND MECHANICAL NAME	DEVICE PART NUMBERS
FN - 44 pin (50-mil pin spacing)	PLASTIC LEADED CHIP CARRIER (PLCC)	FN(S-PQCC-J**) PLASTIC J-LEADED CHIP CARRIER	TMS370C040AFNA TMS370C040AFNL TMS370C040AFNT TMS370C042AFNA TMS370C042AFNL TMS370C042AFNL TMS370C340AFNA TMS370C340AFNL TMS370C340AFNT TMS370C342AFNA TMS370C342AFNL TMS370C342AFNL TMS370C342AFNT TMS370C742AFNT
FZ - 44 pin (50-mil pin spacing)	CERAMIC LEADED CHIP CARRIER (CLCC)	FZ(S-CQCC-J**) J-LEADED CERAMIC CHIP CARRIER	SE370C742AFZT
JD - 40 pin (100-mil pin spacing)	CERAMIC DUAL-IN-LINE PACKAGE (CDIP)	JD(R-CDIP-T**) CERAMIC SIDE-BRAZE DUAL-IN-LINE PACKAGE	SE370C742AJDT
N - 40 pin (100-mil pin spacing)	PLASTIC DUAL-IN-LINE PACKAGE (PDIP)	N(R-PDIP-T**) PLASTIC DUAL-IN-LINE PACKAGE	TMS370C040ANA TMS370C040ANL TMS370C040ANT TMS370C042ANA TMS370C042ANL TMS370C042ANT TMS370C340ANA TMS370C340ANL TMS370C340ANT TMS370C342ANA TMS370C342ANL TMS370C342ANL TMS370C342ANT TMS370C742ANT
JC - 40 pin (70-mil pin spacing)	CERAMIC SHRINK DUAL-IN-LINE PACKAGE (CSDIP)	JC(R-CDIP-T40) CERAMIC SIDE-BRAZE DUAL-IN-LINE PACKAGE	SE370C742AJCT
NJ - 40 pin (70-mil pin spacing)†	PLASTIC SHRINK DUAL-IN-LINE PACKAGE (PSDIP)	NJ(R-PDIP-T**) PLASTIC SHRINK DUAL-IN-LINE PACKAGE	TMS370C040ANJA TMS370C040ANJL TMS370C040ANJT TMS370C042ANJA TMS370C042ANJL TMS370C042ANJL TMS370C340ANJA TMS370C340ANJL TMS370C340ANJT TMS370C342ANJA TMS370C342ANJL TMS370C342ANJT TMS370C342ANJT

Table 20. TMS370Cx4x Family Package Type and Mechanical Cross-Reference

[†] NJ formerly known as N2; the mechanical drawing of the NJ is identical to the N2 package and did not need to be requalified.

SPNS016C - NOVEMBER 1992 - REVISED FEBRUARY 1997

MECHANICAL DATA

The following packaging information and addendum reflect the most current data available for the designated device(s). This data is subject to change without notice and without revision of this document.

MPLC004A - OCTOBER 1994

PLASTIC J-LEADED CHIP CARRIER

FN (S-PQCC-J**)

NOTES: A. All linear dimensions are in inches (millimeters).

B. This drawing is subject to change without notice.

C. Falls within JEDEC MS-018

MJLC003A - FEBRUARY 1995

J-LEADED CERAMIC CHIP CARRIER

FZ (S-CQCC-J**) 28 LEAD SHOWN

- NOTES: A. All linear dimensions are in inches (millimeters).
 - B. This drawing is subject to change without notice.
 - C. This package can be hermetically sealed with a ceramic lid using glass frit.

MCDI006 - OCTOBER 1994

CERAMIC SIDE-BRAZE DUAL-IN-LINE PACKAGE

JC (R-CDIP-T40)

NOTES: A. All linear dimensions are in inches (millimeters).

- B. This drawing is subject to change without notice.
- C. This package can be hermetically sealed with a metal lid.
- D. The terminals are gold plated.

MCDI005 - JANUARY 1998

JD (R-CDIP-T**)

CERAMIC SIDE-BRAZE DUAL-IN-LINE PACKAGE

24 PINS SHOWN

NOTES: A. All linear dimensions are in inches (millimeters).

- B. This drawing is subject to change without notice.
- C. This package is hermetically sealed with a metal lid.
- D. The terminals are gold-plated.

MPDI008 - OCTOBER 1994

N (R-PDIP-T**)

PLASTIC DUAL-IN-LINE PACKAGE

24 PIN SHOWN

NOTES: A. All linear dimensions are in inches (millimeters).

- B. This drawing is subject to change without notice.
- C. Falls within JEDEC MS-011
- D. Falls within JEDEC MS-015 (32 pin only)

MSDI005 - OCTOBER 1994

NJ (R-PDIP-T**)

PLASTIC SHRINK DUAL-IN-LINE PACKAGE

40 PIN SHOWN

NOTES: A. All linear dimensions are in inches (millimeters). B. This drawing is subject to change without notice.

⁽¹⁾ The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

⁽³⁾ MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

⁽⁴⁾ Only one of markings shown within the brackets will appear on the physical device.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

24-Jan-2013

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have *not* been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
