The information given in this document shall in no event be regarded as a guarantee of conditions or characteristics. With respect to any examples or hints given herein, any typical values stated herein and/or any information regarding the application of the device, Infineon Technologies hereby disclaims any and all warranties and liabilities of any kind, including without limitation, warranties of non-infringement of intellectual property rights of any third party.

### **Information**

For further information on technology, delivery terms and conditions and prices, please contact the nearest Infineon Technologies Office ([www.infineon.com](http://www.infineon.com)).

### **Warnings**

Due to technical requirements, components may contain dangerous substances. For information on the types in question, please contact the nearest Infineon Technologies Office.

Infineon Technologies components may be used in life-support devices or systems only with the express written approval of Infineon Technologies, if a failure of such components can reasonably be expected to cause the failure of that life-support device or system or to affect the safety or effectiveness of that device or system. Life support devices or systems are intended to be implanted in the human body or to support and/or maintain and sustain and/or protect human life. If they fail, it is reasonable to assume that the health of the user or other persons may be endangered.

## 1 Product Description

### 1.1 Overview

The TLI4906x is a high precision Hall Effect Switch with highly accurate switching thresholds for ambient operating temperatures up to 125°C.

The TLI4906K is available in a PG-SC59-3-4 package, the TLI4906L in a PG-SSO-3-2 package.

### 1.2 Features

- 2.7 V to 18 V supply voltage operation.
- Operation from unregulated power supply.
- High sensitivity and high stability of the magnetic switching points.
- High resistance to mechanical stress by active error compensation.
- Reverse battery protection (-18 V).
- Superior temperature stability.
- Low jitter (typically 1  $\mu$ s).
- High ESD performance ( $\pm$  4 kV HBM).
- Digital output signal (open-drain).

### 1.3 Target Applications

The TLI4906x is ideally suited for all industrial and consumer applications that require a high precision switching thresholds for position sensing. It can be used for example for: security systems, alignment control, push buttons, keyboards, key switches, machine tools, etc.

| Product Name       | Product Type | Ordering Code | Package     |
|--------------------|--------------|---------------|-------------|
| Hall Effect Switch | TLI4906K     | SP000604306   | PG-SC59-3-4 |
| Hall Effect Switch | TLI4906L     | SP000604320   | PG-SSO-3-2  |

## 2 Functional Description

### 2.1 General

Precise magnetic switching thresholds and high temperature stability are achieved by active compensation circuits and chopper techniques on chip. Offset voltages generated by temperature-induced stress or overmolding are canceled so that high accuracy is achieved. The IC has an open collector output stage with 20 mA current sink capability. A wide operating voltage range from 2.7 V to 18 V with reverse polarity protection down to -18 V makes the TLI4906 suitable for a wide range of applications. A magnetic south pole with a field strength above  $B_{op}$  turns the output on. A magnetic north pole exceeding  $B_{rp}$  turns it off.

### 2.2 Pin Configuration

Figure 1 Pin Configuration and sensitive area (Top view, figure not to scale)

### 2.3 Pin Description

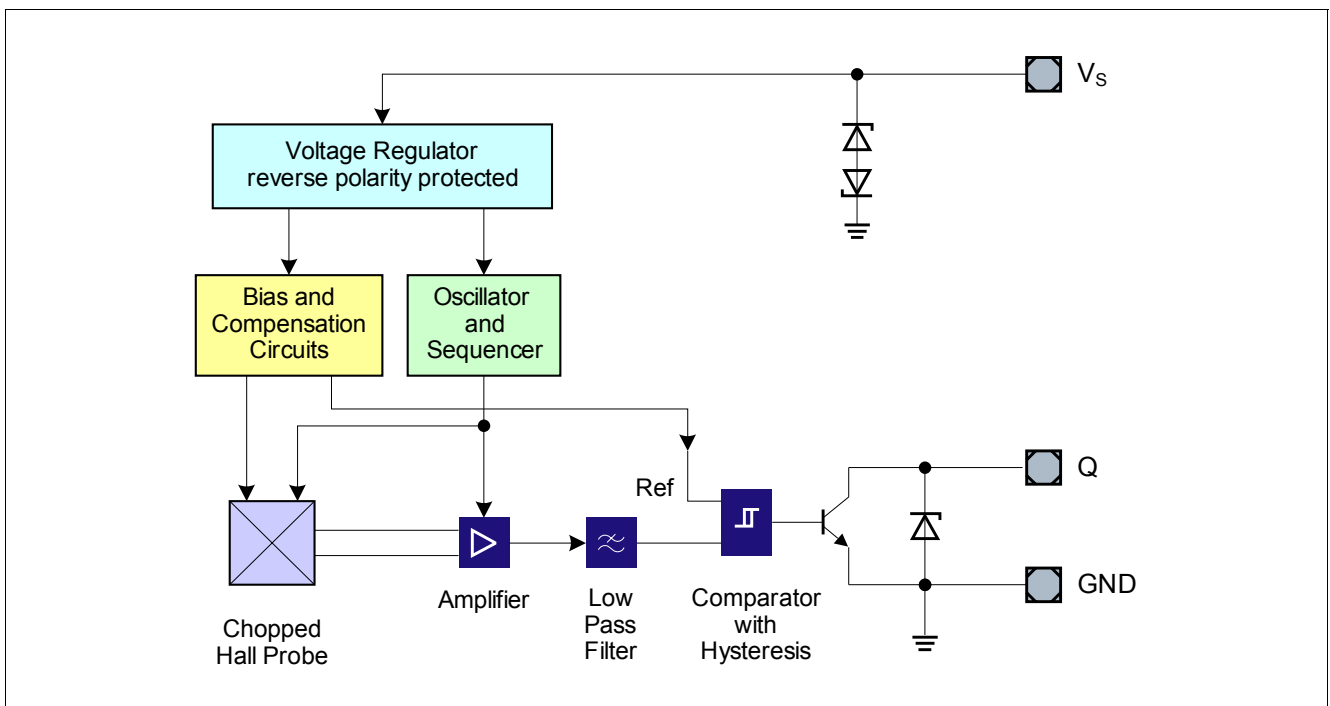

**Table 1 PIN Definitions for the PG-SC59-3-4 package**

| PIN No. | Name  | Function       |
|---------|-------|----------------|
| 1       | $V_s$ | Supply Voltage |
| 2       | Q     | Output         |
| 3       | GND   | Ground         |

**Table 2 PIN Definitions for the PG-SSO-3-2 package**

| PIN No. | Name  | Function       |
|---------|-------|----------------|
| 1       | $V_s$ | Supply Voltage |
| 2       | GND   | Ground         |
| 3       | Q     | Output         |

### 2.4 Block Diagram

**Figure 2 TLI4906x Block Diagram**

## 2.5 Operating Modes and States

### Field Direction and Definition

Positive magnetic fields correspond to the south pole of the magnet targeting the branded side of the package.

Figure 3 Definition of the Magnetic Field direction

Figure 4 Output Signal

## 2.6 Functional Block Description

The chopped Hall Effect Switch comprises a Hall probe, a bias generator, compensation circuits, an oscillator and an output transistor. The bias generator provides currents to the Hall probe and the active circuits. Compensation circuits stabilize response of the IC over temperature and reduce the impact of process variations.

The Active Error Compensation rejects offsets in the signal path and reduces the impact of mechanical stress in the package caused by molding, soldering and thermal effects.

The chopper technique together with the threshold generator and the comparator ensure high accurate magnetic switching points.

### 3 Specification

#### 3.1 Application circuit

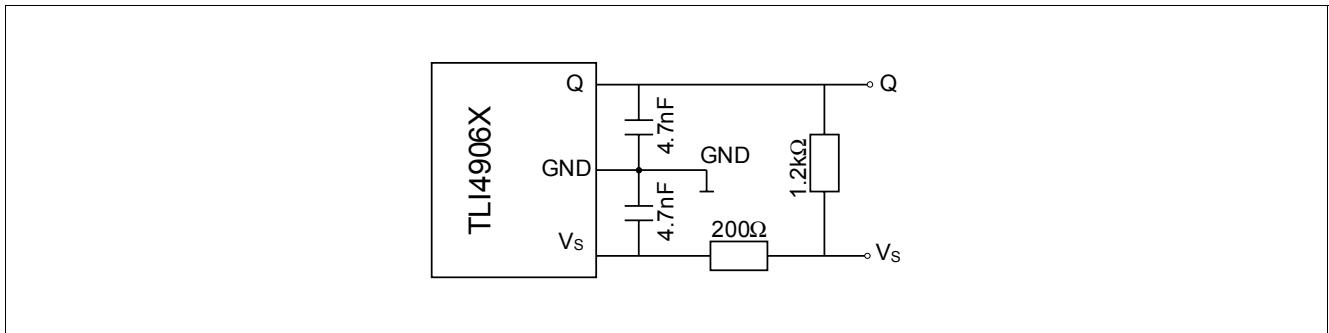

Figure 5 Application circuit

It is recommended to use a resistor of 200 Ω in the supply line for current limitation in the case of an overvoltage pulse. Two capacitors of 4.7 nF enhance the EMC performance. The pull-up of 1.2 kΩ limits the current through the output transistor.

#### 3.2 Absolute Maximum Ratings

Stress above the maximum values listed in this section may cause permanent damage to the device. Exposure to absolute maximum rating conditions for extended periods may affect the reliability of the device. Exceeding only one of these values may cause irreversible damage to the device.

Table 3 Absolute Maximum Ratings

| Parameter                                | Symbol             | Values |      |           | Unit | Note / Test Condition |
|--|--------------------|--------|------|-----------|------|-----------------------|
|  |                    | Min.   | Typ. | Max.      |      |                       |
| Maximum Ambient Temperature              | $T_A$              | - 40   | –    | 125       | °C   |                       |
| Maximum Junction Temperature             | $T_J$              | - 40   | –    | 150       | °C   |                       |
| Supply Voltage                           | $V_S$              | - 18   | –    | 18        | V    |                       |
| Supply current through protection device | $I_S$              | -50    | –    | 50        | mA   |                       |
| Output Voltage                           | $V_{OUT}$          | - 0.7  | –    | 18        | V    |                       |
| Storage Temperature                      | $T_S$              | - 40   | –    | 150       | °C   |                       |
| Magnetic flux density                    | $B$                | –      | –    | unlimited | mT   |                       |
| ESD Robustness HBM:<br>1.5 kΩ, 100 pF    | $V_{ESD,HBM}^{1)}$ | –      | –    | 4         | kV   |                       |

1) According to EIA/JESD22-A114-E

### 3.3 Operating Range

The following operating conditions must not be exceeded in order to ensure correct operation of the TLI4906x. All parameters specified in the following sections refer to these operating conditions unless otherwise mentioned.

**Table 4 Operating Range**

| Parameter                   | Symbol | Values |      |      | Unit | Note / Test Condition |
|-----------------------------|--------|--------|------|------|------|-----------------------|
|                             |        | Min.   | Typ. | Max. |      |                       |
| Supply Voltage              | $V_S$  | 2.7    | –    | 18   | V    |                       |
| Output Voltage              | $V_Q$  | -0.7   | –    | 18   | V    |                       |
| Output Current              | $I_Q$  | 0      | –    | 20   | mA   |                       |
| Maximum Ambient Temperature | $T_A$  | -40    | –    | 125  | °C   |                       |

### 3.4 Electrical Characteristics

Product characteristics include the spread of values guaranteed within the specified voltage and ambient temperature range. typical characteristics are the median of the production (at  $V_S=12V$  and  $T_A=25^\circ C$ ).

**Table 5 Electrical Characteristics**

| Parameter  | Symbol      | Values |      |                  | Unit          | Note / Test Condition                        |
|--|-------------|--------|------|------------------|---------------|--|
|  |             | Min.   | Typ. | Max.             |               |  |
| Supply Current                                       | $I_S$       | 2      | 4    | 6                | mA            | $V_S=2.7 V \dots 18 V$                       |
| Reverse Current                                      | $I_{SR}$    | 0      | 0.2  | 1                | mA            | $V_S=-18 V$                                  |
| Output Saturation Voltage                            | $V_{QSAT}$  | –      | 0.3  | 0.6              | V             | $I_Q=20 mA$                                  |

|  |             | –      | –    | 190              | K/W           | TLI4906L                                     |

1) See [Figure 6](#)

2) To operate the sensor at maximum switching frequency, the value of the magnetic signal amplitude must be 1.4 times higher than the static fields. This is due to the -3 dB corner frequency of the low pass filter in the signal path.

3) Systematic delay between magnetic threshold reached and output.

4) Jitter is the unpredictable deviation of the output switching delay.

5) Time from applying  $V_S > 2.7 V$  to the sensor until the output state is valid.

6) Relationship between junction and ambient temperature:  $T_J = T_{amb} + R_{thja} \cdot (V_S \cdot I_S + V_{QS} \cdot I_Q)$ .
